## 1 P R O C E E D I N G S

2 (At 9:32 a.m., proceedings commenced.)

3           **THE COURT:** Good morning. I think we're still  
4 waiting on one juror, but she's in the building and just not  
5 quite up to the jury room yet. I thought I'd go ahead and  
6 check in with you all and see if there was anything we needed  
7 to take care of before the jury comes.

8           **MR. SANTHANAM:** Yes, Your Honor. Yesterday, last  
9 night, we received demonstrative slides from the defendants  
10 that they plan to use with Mr. Jarosz, their damages expert.  
11 There are two slides that we object to. And if you would like,  
12 we can put them up on the screen for you to review.

13           **THE COURT:** Okay.

14           **MR. SANTHANAM:** Slide 20 and Slide 22.  
15 Essentially -- this is one of the slides that they provided as  
16 part of their demonstratives. It's an excerpt from the  
17 deposition of Dr. Wilner. We've heard no testimony in this  
18 case about any non-infringing alternatives. It appears they're  
19 going to try and rely on a deposition excerpt of Dr. Wilner  
20 regarding a conversation he had with Dr. Alan Whitton about  
21 certain increases in prices or costs in manufacturing. We have  
22 heard absolutely no foundation for this, and what it amounts  
23 to --

24           **THE COURT:** Who's this going to come in through?

25           **MR. NEUMAN:** Beg your pardon, this is going to come

1 in through John Jarosz, our damages expert, testimony --  
2 information he relied on to form his opinions, not for the  
3 truth.

4           **THE COURT:** All right. I was just making sure.

5           **MR. SANTHANAM:** And our objection is two-fold, Your  
6 Honor.

7           **THE COURT:** Yes?

8           **MR. SANTHANAM:** First, it basically amounts to an  
9 improper deposition designation. They're putting up an excerpt  
10 of a deposition. If they wanted to do this, they should have  
11 provided notice back on June 2nd when pretrial disclosures were  
12 due; and, second, there's been absolutely no foundation for  
13 this in this trial. If they wanted to ask the witnesses  
14 Dr. Whittom and Dr. Wilner, they had the opportunity to do so.  
15 They shouldn't be allowed to put forth a deposition excerpt.

16           **THE COURT:** All right. What does Willowood say?

17           **MR. NEUMAN:** This is information which Mr. Jarosz  
18 provided as a basis for his royalty report in his supplemental  
19 expert report provided last year.

20           **THE COURT:** Okay. So there's two parts to the  
21 objection.

22           **MR. SANTHANAM:** That's correct.

23           **THE COURT:** Part 1, can they show the deposition  
24 transcript to the jury?

25           **MR. SANTHANAM:** That's correct, and we object to

1 that, Your Honor, because it's an improper deposition  
2 designation.

3           **THE COURT:** Part 2 is can Mr. Jarosz testify about  
4 this?

5           **MR. SANTHANAM:** Right. And if Your Honor would  
6 recall, we filed a Daubert motion saying that Mr. --

7           **THE COURT:** No, I remember. I just want to be sure I  
8 understood your objection. So if I can ask the Defendant to  
9 respond to those two parts of that, because I'm not  
10 hearing -- I mean, your response doesn't seem responsive, if I  
11 can say it that way.

12           **MR. NEUMAN:** Well, our response is that -- I'm not  
13 sure why -- tell me why it's not responsive. This is  
14 information that Mr. Jarosz has stated in his expert report  
15 from last year he relied on.

16           **THE COURT:** There has to be -- that doesn't appear to  
17 direct -- to respond to the objection to showing the deposition  
18 testimony to the jury. We went over the prongs of, I think,  
19 it's 703 yesterday about relying on inadmissible evidence -- or  
20 evidence not in evidence -- statements not in evidence. Let me  
21 say it a different way. This is not in evidence, what he  
22 relied on, that I recall. So I'm not -- I'm just not hearing  
23 you respond to that.

24           **MR. NEUMAN:** Well, if we can ask him what he relied  
25 on without showing the exhibits, we'd be prepared to do that.

1                   **THE COURT:** Okay. And then your -- okay. And then  
2 as to the second part, you're saying, well, he relied on it,  
3 and it doesn't have to be admissible for him to rely on it.

4                   **MR. NEUMAN:** Correct, correct.

5                   **THE COURT:** Or in evidence?

6                   **MR. NEUMAN:** Correct.

7                   **MR. SANTHANAM:** Your Honor, they'd be disclosing it  
8 either way by telling the jury --

9                   **THE COURT:** I'm sorry, say again.

10                  **MR. SANTHANAM:** They would be disclosing it either  
11 way by telling the jury what specifically he relied on. It  
12 doesn't have to be a demonstrative on a screen before them. If  
13 they say these are the numbers that I relied on, that's  
14 disclosing his underlying facts.

15                  **THE COURT:** I mean --

16                  **MR. SANTHANAM:** And we would again refer back to the  
17 Daubert motion, Your Honor, where -- our main objection when we  
18 filed our Daubert motion was that he needed bases for his  
19 opinions; and Your Honor's ruling, as we understood it, was  
20 they would need to present factual foundations for his  
21 testimony. They have not.

22                  (Short pause.)

23                  **MR. SANTHANAM:** And they could have --

24                  **THE COURT:** Okay. Stop talking. I'm not pausing to  
25 give you more time. I'm pausing to think, and I have trouble

1 thinking when people are talking, so just give me a minute.

2               Okay. So can I ask the Defendant to respond to this  
3 again, because I know he can rely on evidence -- you know,  
4 evidence is even really the wrong word. An expert doesn't have  
5 to consider only admissible evidence in forming his or her  
6 opinion, but I'm having a little trouble understanding how this  
7 is going to be helpful to the jury when there's nothing to  
8 support it in the record. I mean, the jury --

9               **MR. NEUMAN:** My understanding of Rule 703 is it does  
10 not have to be in the record to be something that the expert  
11 reasonably can rely on.

12               **THE COURT:** But he has no expertise in whether or not  
13 there is a 40 percent or 50 percent increase in cost by using  
14 some other method, and he has no expertise in whether any other  
15 method actually could be used; so if the jury has no  
16 information that there's another method, how is this helpful to  
17 the jury?

18               **MR. NEUMAN:** Because the reason that this information  
19 is relevant to Mr. Jarosz's opinion is in connection with the  
20 hypothetical negotiation to support a reasonable royalty, and  
21 he will concede that he is not an expert as to whether these  
22 percentages are accurate. His testimony will be that the fact  
23 that Syngenta's own people told their expert economist that  
24 these numbers apply supports his view as to what the position  
25 of Syngenta would be in a hypothetical negotiation, not whether

1 these numbers are accurate or not.

2           **THE COURT:** Okay. What does the Plaintiff say?

3           **MR. SANTHANAM:** Your Honor, none of this is in  
4 evidence. If they wanted to put this -- present this basis,  
5 they had the opportunity to ask Dr. Whitton, they had the  
6 opportunity to ask Dr. Wilner, and they chose not to. In fact,  
7 what this reflects is a backdoor attempt to try to bring in  
8 something that's not in evidence having had the opportunity to  
9 question these witnesses about it. So they shouldn't be  
10 allowed to present underlying bases under Rule 703, which  
11 requires the probative value to substantially outweigh the  
12 prejudicial effect. As Your Honor mentioned, there's no basis  
13 in the record for this as of yet.

14           **MR. NEUMAN:** Your Honor, this was --

15           **THE COURT:** Two comments. First, you can't show the  
16 deposition, because I'm generally not letting people do that,  
17 and it's not before the jury otherwise, so -- and I don't think  
18 it comes in under 703. I'll otherwise let you proceed and  
19 overrule the objection to the extent it's to him testifying.

20           Did you have an objection to another slide?

21           **MR. SANTHANAM:** No, Your Honor.

22           **THE COURT:** Is that clear?

23           **MR. SANTHANAM:** Yes.

24           **THE COURT:** Anything else before the jury comes in?

25           **MR. TILLER:** Your Honor, very briefly. As we've been

1 saying, some housekeeping matters. One, we proffered yesterday  
2 but neglected to move into evidence DX-6, DX-118, DX-119 and  
3 DX-121. We would move for their admission.

4           **MR. SANTHANAM:** We don't have any objection, Your  
5 Honor.

6           **THE COURT:** They'll be admitted.

7           **MR. TILLER:** Thank you, Your Honor.

8           And very briefly, I mentioned yesterday a notice that  
9 we were going to be filing that obviously the Court didn't have  
10 to deal with. We sort of -- Mr. Harrell realized at the last  
11 second that if we did it the way we were planning on doing it,  
12 that could subject some Syngenta documents into the public  
13 record, and we wanted to not go down that road, given all the  
14 concerns.

15           **THE COURT:** Okay.

16           **MR. TILLER:** So we have -- it's already been on file.  
17 Your Honor probably hasn't even seen it yet. We filed an  
18 identification -- just a list of the exhibits, and then we'll  
19 come up -- we'll talk to Syngenta about a way to make sure  
20 those are in the record, obviously not going back to the jury.

21           **THE COURT:** Okay. And this has to do with my ruling  
22 on the motions --

23           **MR. TILLER:** The motions in limine.

24           **THE COURT:** -- the week before trial about late  
25 disclosed -- I concluded were late disclosed exhibits?

1                   **MR. TILLER:** Exactly, Your Honor. We just wanted to  
2 make the record clear. That's all.

3                   **THE COURT:** All right. I'll let you all figure that  
4 out. Anything else?

5 MR. TILLER: No, Your Honor.

6 THE COURT: All right. You can bring the jury in.

7 (At 9:44 a.m., jury present.)

8                   **THE COURT:** Good morning. We're ready to continue,  
9 so Willowood can call their next witness.

10                   **MR. NEUMAN:** Your Honor, the defendants call John  
11 Jarosz.

12 THE COURT: Go ahead.

13                   **MR. NEUMAN:** Your Honor, may I approach with a  
14 binder?

15 || THE COURT: You may. Go ahead.

16 JOHN C. JAROSZ,

17 DEFENDANT'S WITNESS, SWORN AT 9:44 A.M.

18 DIRECT EXAMINATION

19 | BY MR. NEUMAN:

20 Q. Good morning. Could you please state your full name for  
21 the record, sir.

22 A. John C. Jarosz.

23 || Q. And what do you do for a living?

24 A. I'm an economist.

25 | Q. Generally, what does an economist do?

1   **A.**   Formally, we study how societies and governments and  
2 industries and consumers allocate resources among themselves.  
3 On a more practical basis, what we do in microeconomics is we  
4 evaluate market dynamics. We evaluate how companies and  
5 consumers act and react in a marketplace to determine what are  
6 prevailing prices and what are the volumes associated with  
7 those prices. We look to see how consumers react to producer  
8 actions and producers react to consumer actions. So it's all  
9 very formal, but we do the best we can to talk about real  
10 activity, and we'll see that through the course of my  
11 testimony, I think.

12   **Q.**   Do you specialize in any particular area of economics?

13   **A.**   Generally, I work in the area of applied microeconomics.  
14 Specifically, my focus is on the evaluation and valuation of  
15 intellectual property rights. A patent is a form of  
16 intellectual property. So I seek to determine how much patents  
17 are worth, sometimes outside of courtroom having nothing to do  
18 with litigation and sometimes in the courtroom when one party  
19 has sued another party for patent infringement, and the  
20 question becomes how much money should be paid?

21   **Q.**   Can you summarize your educational background for the  
22 jury, please.

23   **A.**   Yes. I have a BA, a bachelor's, in economics and  
24 organizational communication from Creighton University, which  
25 is in Omaha, Nebraska. After that, I was a fellowship student

1 in the Ph.D. program in economics at Washington University,  
2 which is in St. Louis. I completed most of the requirements  
3 there, including the preliminary examinations, the background  
4 work that needs to be done, but I ultimately decided not to  
5 finish my Ph.D. at Washington University and was awarded a  
6 master's in economics.

7 **Q.** And what types of courses did you take in working towards  
8 your bachelor's and master's degree?

9 **A.** I took courses in microeconomics and macroeconomics,  
10 government regulation of business, finance, marketing,  
11 management, a whole array of business oriented kind of courses.

12 **Q.** And could you just clarify what microeconomics is as  
13 opposed to what macroeconomics is?

14 **A.** Sure. Microeconomics is the study of how producers and  
15 consumers act when we buy things and companies make things  
16 available to us. Macroeconomics is more the study of the  
17 economy, inflation rates, death rates, those kinds of things.  
18 I know much less about macroeconomics than microeconomics.  
19 Unfortunately, most of times the when I get in a cab, the  
20 driver asks me, You're an economist? So tell me about where  
21 the economy is going. And I say, I have no idea, that's not my  
22 area. What I study is how consumers and producers act.

23 **Q.** Now, why did you decide not to complete your Ph.D. program  
24 at Washington University?

25 **A.** Well, I was in good standing and had the opportunity to

1 complete my Ph.D. but decided at that point I was not  
2 interested in teaching economics at a graduate or at a  
3 university level. The strengths of the programs were a little  
4 bit different than the things I was most interested in, and I  
5 wanted to move closer to a romantic interest of mine, closer to  
6 be near a woman who became my wife, and we've been married for  
7 33 years and have raised six kids, so I think that was a good  
8 decision.

9 **Q.** And did you obtain any other degrees after that?

10 **A.** Yes. After that, after I was married, I attended law  
11 school at the University of Wisconsin in Madison, Wisconsin.  
12 There, I took the normal array of courses in law, but I had a  
13 particular focus on topics having to do with law and economics.  
14 I ultimately received my JD from the University of Wisconsin.

15 **Q.** Have you ever practiced law?

16 **A.** I have not. I've been on inactive status in the State Bar  
17 of Wisconsin for the last 32 years.

18 **Q.** Are you a member of any professional organizations or  
19 associations?

20 **A.** I'm a member of quite a number. It helps me keep up and  
21 active in the industry and in the discipline. I'm a member of  
22 the American Intellectual Property Law Association, the  
23 American Economics Association, the American Law & Economics  
24 Association, the Licensing Executive Society, the Intellectual  
25 Property Owners Association, and The Sedona Conference. Those

1 are all places that I contribute to and, importantly, get  
2 information from about developments.

3 **Q.** You mentioned The Sedona Conference. What is that?

4 **A.** It's a small group of judges and lawyers and economists  
5 who are working together to try to move the law forward in a  
6 just and a reasonable fashion. We're trying to make changes to  
7 the extent we can to help the law become more accessible and  
8 more sensible to the extent we can. I have had a particular  
9 focus on the evaluation and presentation of patent damages.

10 **Q.** And do you serve on any committees or working groups of  
11 The Sedona Conference?

12 **A.** Yes, I've been fairly active in several working groups.  
13 Working groups are smaller sets within Sedona that focus on  
14 particular issues. The two groups I've been most active with  
15 have focused on early resolution of damages cases so we don't  
16 get all the way to trial like this, try to get rid of the cases  
17 that shouldn't come to trial. And, also, I've been very active  
18 in evaluation and presentation of patent damages. A particular  
19 subgroup focuses on reasonable royalty estimation in  
20 particular, and I've been very active with that.

21 **Q.** How does one get appointed to -- or have the opportunity  
22 to serve on these working groups?

23 **A.** It's a combination of your interest in topics, your  
24 availability to participate in these working groups, and your  
25 promise to actually do work rather than just read and comment,

1 to actually meet and write and present findings, and so those  
2 of us in the working groups have all committed to do that.

3 **Q.** Are there any other ways that you keep active in the field  
4 of economics?

5 **A.** Yes. I fairly regularly research and publish articles in  
6 professional practitioner journals. I give presentations on a  
7 regular basis, both live presentations and webinar  
8 presentations, and I teach classes at various institutions.

9 **Q.** Where do you teach classes?

10 **A.** Among the places that I teach are the Georgetown Law  
11 School, the George Washington Law School, and the US Patent and  
12 Trademark Office.

13 **Q.** Have you offered an expert opinion -- economic opinion in  
14 other cases involving the appropriate amount of damages  
15 resulting from alleged patent infringement?

16 **A.** Yes. I've been involved in hundreds of patent  
17 infringement cases, more than 300 probably, and I've provided  
18 testimony in courtrooms like this having do with patent damages  
19 on perhaps 60 occasions over the years.

20           **THE COURT:** Did you say 6 or 60?

21           **THE WITNESS:** Six-zero.

22 **BY MR. NEUMAN:**

23 **Q.** And has that been on behalf of -- your testimony been on  
24 behalf of plaintiffs or defendants or both? How would you sort  
25 that out?

1   **A.**   It is about 50/50. In other words, about half the time my  
2 work is for companies who own patent rights and are attempting  
3 to enforce them, and about half of my work is working for  
4 companies who have been accused of infringement and trying to  
5 decide how much money should be paid.

6   **Q.**   Where do you work?

7   **A.**   I work at a company called Analysis Group, Incorporated.  
8 We are an economic financial strategy and healthcare consulting  
9 firm of about 750 people. We have offices throughout North  
10 America and overseas. We now have three overseas offices in  
11 addition to, I think, nine North American offices.

12   **Q.**   What is your position, title, at Analysis Group?

13   **A.**   I'm a managing principal of the firm, which means I'm one  
14 of the owners of the firm. I'm also the founder and director  
15 of the firm's Washington, D.C., office.

16   **Q.**   How long have you been employed by Analysis Group?

17   **A.**   Since March of 1996, so that's about 21 -- a little bit  
18 over 21 years.

19   **Q.**   What did you do prior to that?

20   **A.**   For about ten years prior to that, I was at a similar  
21 economic consulting firm. I was also head of that firm's  
22 Washington, D.C., office.

23   **Q.**   Now, is Analysis Group being paid for your work in this  
24 case?

25   **A.**   We're being paid for the effort that we undertake to look

1 at the issues. So we're getting paid for the time that we  
2 devote to our study.

3 **Q.** Is that payment dependent in any way on the outcome of  
4 this case?

5 **A.** Not at all.

6 **Q.** Have you provided expert testimony or consulting services  
7 in connection with the agrichemical business?

8 **A.** I have on several occasions in the past. It's not my  
9 speciality, but it is one of the areas in which I have done  
10 work. Included is the fact that I worked for Syngenta on a  
11 number of occasions in the past on patent infringement damages  
12 cases.

13 **Q.** Have you ever testified -- can you give an example of two  
14 of that kind of work?

15 **A.** Well, I work with companies that have had skirmishes about  
16 genetically-modified seed. And I've worked for companies that  
17 have been in court having to do with herbicide intellectual  
18 property issues. As I said, I've worked for Syngenta in the  
19 past.

20 **Q.** Have you ever testified as an expert on damages here in  
21 North Carolina before?

22 **A.** Yes, on several occasions.

23                   **MR. NEUMAN:** Your Honor, we offer Mr. Jarosz as an  
24 expert in the field of intellectual property valuation and the  
25 analysis of damages arising from alleged infringement of

1 intellectual property.

2           **MR. SANTHANAM:** Your Honor, we do object, but we're  
3 going to address that on cross-examination.

4           **THE COURT:** You don't have any questions about his  
5 qualifications now?

6           **MR. SANTHANAM:** Not at this time.

7           **THE COURT:** All right. He may so testify.

8 **BY MR. NEUMAN:**

9           **Q.** Mr. Jarosz, what have you been asked to do in this case?

10          **A.** I was asked to do two things. First, evaluate the work  
11 that was done by Dr. Wilner on the damages issues; and  
12 secondly, come to my own independent opinion as to how much  
13 money should be paid in damages if the jury finds that the  
14 patents are valid and infringed.

15          **Q.** And did you perform this work alone?

16          **A.** No. I work with a number of colleagues of mine at  
17 Analysis Group, three or four that work very closely with me,  
18 and five or six others have been available on an as-needed  
19 basis.

20          **Q.** Did they all work under your supervision on this project?

21          **A.** Yes.

22          **Q.** What materials, generally speaking, did you review in  
23 conducting your work for this case?

24          **A.** We looked at thousands of pages of material. Fortunately,  
25 these days, much of that material is electronic so you don't

1 have to print it all out. But we looked at quite a number of  
2 documents produced by both Syngenta and Willowood, things  
3 describing marketplace, financial performance, sales  
4 performance, market share, internal correspondence.

5 I've also looked at quite a bit of deposition  
6 testimony for a number of the witnesses that have been deposed  
7 here. I looked at the court filings that had to do with the  
8 damages topics, and I've evaluated and reviewed the various  
9 expert reports.

10 **Q.** And have you been present during the course of this trial  
11 listening to the witness testimony?

12 **A.** Yes, I have.

13 **Q.** For the entire trial?

14 **A.** Yes, I believe so. I can't remember if I stepped out for  
15 a moment during one segment, but I don't -- I don't think I  
16 did.

17 **Q.** What's your understanding of the patented technology at  
18 issue in this case?

19 **A.** I understand that are two patents that are called compound  
20 patents, the '076 and '256, that cover the active ingredient  
21 azoxystrobin. I understand that there are two other patents,  
22 though, 136 and -- '138 and the '761, I think I have those  
23 numbers correct, that deal with particular processes to make  
24 azoxystrobin.

25 **Q.** Now, are you here to testify and offer an opinion about

1 whether Syngenta's patents are valid and enforceable?

2 **A.** No, other people have addressed that topic.

3 **Q.** Now, before we dive into the details of your opinions, you  
4 understand that Syngenta claims that it has suffered lost  
5 profits as a result of Willowood's alleged infringement?

6 **A.** Yes, I understand that.

7 **Q.** And what are lost profits?

8 **A.** Lost profits can be thought of as the sales that the  
9 patent owner may have lost due to the infringing activity and  
10 the profits associated with those sales. In particular, there  
11 are two components of lost profits.

12 Number one is lost volumes, where there are accounts  
13 that were made by Willowood that would otherwise have been made  
14 by Syngenta. Secondly, was there price erosion; in other  
15 words, did Syngenta need to lower its price because of the  
16 alleged infringement. So lost sales and price erosion are the  
17 two components of lost profits. Lost sales is very common in a  
18 lost profits analysis. Price erosion is very rare.

19 **Q.** Now, if lost profits are found not to be proven in this  
20 case, is there another accepted method to determine damages in  
21 patent infringement cases?

22 **A.** Yes. The alternative is something called a reasonable  
23 royalty.

24 **Q.** Could you explain at a very high level what a reasonable  
25 royalty is?

1   **A.**   A reasonable royalty can be thought of as a license fee  
2   that should have been paid by the alleged infringer to the  
3   owner of the patents for use of the patents. So it's a  
4   payment, assuming infringing activity.

5   **Q.**   Now, have you reached a conclusion to a reasonable degree  
6   of economic certainty as to what reasonable royalties would be  
7   in this case, assuming infringement of the patents at issue?

8   **A.**   Yes. I've drawn a conclusion as to reasonable royalties.  
9   I've also drawn a conclusion as to lost profits.

10   **Q.**   I'm asking you about reasonable royalties.

11   **A.**   Yes.

12                 **MR. NEUMAN:** All right. Could we please look  
13   at -- and Bonnie, could you put up Jarosz Slide 5,  
14   Demonstrative 5. Beg your pardon, 6.

15   **BY MR. NEUMAN:**

16   **Q.**   Does this slide summarize your opinions as to reasonable  
17   royalty?

18   **A.**   Yes, it does.

19   **Q.**   And could you just state what your opinions are?

20   **A.**   For the compound patents, I believe a reasonable royalty  
21   payment is not -- it's insignificant based on testimony that  
22   I've heard and I think we'll be discussing in a short while.

23                 With regard to the '138 patent, reasonable royalty  
24   damages are no more than \$1.4 million. With regard to the '761  
25   patent, reasonable royalties are no more than \$900,000.

1   **Q.**   All right. Thank you, sir. You can take that down,  
2   Bonnie. We'll come back to reasonable royalties later.

3                 Let's focus for now on lost profits. Do you believe  
4   that Syngenta has shown that it has suffered lost profits on  
5   account of the infringement of the compound patents?

6   **A.**   No.

7   **Q.**   Let's talk about the compound patents. Why do you -- why  
8   do you say that?

9   **A.**   Underlying Dr. Wilner's analysis of lost profits is a  
10 belief that it was necessary for Willowood to get in the market  
11 for there to be the importation of this 5 kilograms, or  
12 11 pounds, of azoxystrobin technical in 2013. And because of  
13 that, Willowood was able to get to the market sooner than it  
14 otherwise should have been able to and impacted Syngenta to the  
15 tune of \$75.6 million.

16                 In fact, Willowood did not need to import that  
17 5 kilograms to enter the market when it did to get EPA approval  
18 on time and to enter it in the middle of 2014. It had the  
19 ability to conduct all the necessary testing overseas that  
20 would not have infringed the compound patents, and everything  
21 else would have remained the same.

22   **Q.**   What's the basis for that understanding, Mr. Jarosz?

23   **A.**   It primarily comes from the testimony of Janelle Kay, who  
24 testified a few days ago about overseas testing and the ease  
25 with which that could have been done by Willowood, and I think

1 Mr. Brian Heinze talked about that topic as well.

2 Q. Has Dr. Wilner -- sorry. You were here for Dr. Wilner's  
3 testimony?

4 A. Yes, I was.

5 Q. Has he cited any evidence to contradict Ms. Kay's and  
6 Mr. Heinze's testimony on that issue?

7 A. No. In fact, he testified he didn't even investigate that  
8 issue.

9 Q. Okay. Now, let's discuss your assessment of Dr. Wilner's  
10 analysis. You're aware that Dr. Wilner has testified that the  
11 appropriate compensation here is \$76 million -- at least  
12 \$76 million in lost profit damages for the compound patent  
13 infringement?

14 A. Yes. I think, specifically, he said \$75.6 million.

15 Q. Beg your pardon. You're right.

16 Now, could you -- is there -- do you have a  
17 demonstrative that explains your understanding of how Dr.  
18 Wilner arrived at his numbers?

19 A. Yes, I do.

20 **MR. NEUMAN:** Bonnie, could you put up Jarosz  
21 Demonstrative 7.

22 **BY MR. NEUMAN:**

23 Q. Do you have that in front of you, Mr. Jarosz?

24 A. Yes, I do.

25 Q. So using this demonstrative, could you walk through for

1 the jury how Dr. Wilner derived this \$75.6 million damages  
2 figure?

3 **A.** Yes. He did it in three steps. He evaluated what he  
4 thought Syngenta planned to obtain in profits for azoxystrobin  
5 from 2014 onward. He then sought to determine what they should  
6 have received in light of market conditions. And, third, he  
7 evaluated what they did receive in gross profits, and  
8 subtracted what they did receive from what they should have  
9 received.

10 So, to be a little bit more specific, the top left  
11 chart there, called "Estimated Budget," Dr. Wilner started with  
12 the budget for 2014 and plotted it here at the top of that  
13 orange line. He says this is what Syngenta planned to receive  
14 in the business. He then estimated what the budget should have  
15 been in 2015, 2016, and 2017. In other words, he adjusted  
16 Syngenta's budgets based on market conditions and said they  
17 should have had budgets that are reflected in that orange line.

18 The second step, then, which is right below that, is  
19 he said, I understand that other things were going on in the  
20 marketplace. It was a tough business, and there were other  
21 factors that might explain why Syngenta wouldn't realize its  
22 budget for azoxystrobin. And he said, the way to adjust for  
23 that is to see how the market impacted mesotrione. In other  
24 words, the same factors that impacted mesotrione should have  
25 impacted azoxystrobin, so let me adjust that budget down. And

1 so, what was the orange line for Dr. Wilner becomes the red  
2 line. He adjusts it ever so slightly for events occurring in  
3 the marketplace.

4           Then, in his third step, which is shown off to the  
5 right, he says, let's take that green line and compare that  
6 with the blue line, which is what Syngenta actually realized on  
7 all of its azoxystrobin products for gross profits, and that  
8 difference, that shaded gray area, is lost profits.

9           Now, there's one other very small thing that he did  
10 here; it's almost not worth mentioning. He deducted a little  
11 bit more in additional costs. It was .1 percent of gross  
12 profits to account for some overhead costs. But, for the most  
13 part, what you see here in the third panel is what results in  
14 his \$75.6 million number.

15 **Q.** Have you prepared a slide that summarizes your primary  
16 critiques of Dr. Wilner's analysis?

17 **A.** Yes, I have.

18           **MR. NEUMAN:** Bonnie, could you bring up Jarosz 8,  
19 please.

20 **BY MR. NEUMAN:**

21 **Q.** Does this slide reflect at a high level your critiques --  
22 primary critiques of Dr. Wilner's analysis?

23 **A.** Yes. I've broken it down into three categories. First,  
24 he relied extremely heavily on Syngenta forecasts, which have  
25 been shown to be historically inaccurate. Second, the

1 adjustment he made in those forecasts was based only on the  
2 mesotrione experience, yet mesotrione is not a sufficiently  
3 comparable benchmark. And last, he over-emphasized the  
4 importance of Willowood. In other words, there were other  
5 generics before Willowood and during Willowood's time. They  
6 would have continued in the marketplace. And with Willowood  
7 gone, they likely would have been more aggressive trying to  
8 obtain sales and profits. Those companies would not have gone  
9 away.

10 **Q.** All right. Let's talk about each of these in a little  
11 more detail. So, first, let's talk about Syngenta's budget  
12 forecasting. Is it important that Syngenta's forecasting be  
13 accurate in order for Dr. Wilner's approach to be reliable and  
14 credible?

15 **A.** It's absolutely critical. It was -- at the heart of the  
16 first step of the analysis was the budget forecast, in  
17 particular, the 2014 budget forecast. So, the higher that is,  
18 the higher the damages are; the lower it is, the lower damages  
19 are. So everything is keyed off the budget forecast. That's  
20 the most important starting or building block for his analysis.

21 **Q.** And have you taken a look a little more specifically at  
22 how sensitive Dr. Wilner's damages numbers are to variations in  
23 the budget?

24 **A.** Yes, I have.

25 **Q.** And could you give the jury an illustration -- some

1 numerical illustrations of how his damages calculation would  
2 vary depending on various swings in the accuracy of the  
3 budgets?

4 **A.** Very small changes in just the 2014 budget have dramatic  
5 impacts on his damages number. A 10 percent change impacts his  
6 damages number by \$46 million. A 20 percent change, in other  
7 words, an inaccuracy of 20 percent, adjusts the number by  
8 \$96 million. And a 30 percent change adjusts it by  
9 \$140 million. So the damages are very, very sensitive to the  
10 starting point, and now, I'm just talking about the one year,  
11 the 2014 starting point.

12 **Q.** Did Dr. Wilner, to your understanding, examine how  
13 reliable Syngenta's forecasts were in the past?

14 **A.** No, he did not. He just accepted those budgets as they  
15 were presented.

16 **Q.** Now, you mentioned that those budgets exhibit significant  
17 variability and limited accuracy. Let's talk about those  
18 forecasts. Could you flip to Demonstrative 9, please, Bonnie?

19 And could -- does this slide depict the variations in  
20 the accuracy of Syngenta's budget forecasting over a number of  
21 years?

22 **A.** Yes. You can see that this has been a very difficult  
23 business to forecast in, and Syngenta has not done a  
24 particularly good job. It certainly has tried, but there's  
25 been a lot that has resulted in actual performance varying

1 quite a bit from projected performance.

2 So you see, in 2009 and 2010, which is well before  
3 any of the activity that's at issue here occurred, that the  
4 budget was off by 39 to 50 percent. Some of this was discussed  
5 in the testimony of Mr. Cecil. I just portrayed these in bars,  
6 but the underlying numbers were there. And you'll see  
7 virtually every year, the budget and actual difference is quite  
8 substantial. In 2013, again, before impacts that Dr. Wilner's  
9 talking about, it was off by almost 18 percent.

10 So you see there is quite a bit of variation between  
11 budget and actual. The budget for Syngenta has not been  
12 particularly successful at projecting what the actual  
13 performance would be.

14 **Q.** Remind the jury, if the budget is off by 20 percent,  
15 what -- how does that reduce the damages calculation?

16 **A.** The damages become zero under Dr. Wilner's analysis.

17 **Q.** Now, did Dr. Wilner provide any explanation for these wide  
18 variations?

19 **A.** After the fact, he said -- and he talked about this the  
20 other day in testimony. He said five of the six years, I think  
21 he was talking about 2009 through 2014, there's an explanation  
22 for why five of those six years are off, and it's a one-time  
23 explanation. So he acknowledged that only 2012 is close and  
24 all the others are off. He said, for the early ones, it was  
25 because of the Great Recession. He pointed us to 2009 through

1 2011.

2                   Curiously, though, 2011, the actual was higher than  
3 the budget, so I'm not quite certain of his point there. And  
4 then, with the later points, he said, well, there was a Great  
5 Midwestern Drought in 2012, and presumably, that impacted 2013.  
6 So these years were all off for reasons he could explain after  
7 the fact.

8                   The fact of the matter is, however, that the budgets  
9 have not been particularly accurate.

10 **Q.** Did Dr. Wilner do any -- make any effort to test the  
11 validity of his explanations of his hypotheses about the causes  
12 of these variations, drought, the Great Recession, and so  
13 forth?

14 **A.** No. I think the only thing that he did is say he was  
15 convinced that there was a careful process in putting the  
16 budget together, but he didn't look at earlier results or test  
17 why these differences occurred, and as a result, come to the  
18 conclusion that a budget is a good basis for his damages  
19 amount.

20 **Q.** So to be specific, in the face of these kinds of swings in  
21 budget inaccuracy, both over and under predicting actual sales,  
22 if you were to hypothesize that for certain years those  
23 variations were due to the great recession, would you take that  
24 hypothesis at face value as an economist, or would you try to  
25 validate and verify that particular assumption?

1   **A.**   I would try to validate it in two ways. First, I would  
2 say, okay, let's go look to see how close the budget was versus  
3 actual before the great recession. The company has been in the  
4 azoxystrobin business since approximately the year 2000, so why  
5 not go look to see whether before the great recession the  
6 budget was a pretty good estimator, but he didn't do that, so I  
7 don't know whether that was valid.

8                 And then I also, if I had seen these kind of  
9 variations, would have asked myself, what precisely went into  
10 the process of determining the budgets. Why were they so  
11 wrong, and I would have liked to seen if the great recession  
12 was completely unanticipated in 2009 and then 2010 and then  
13 2011. And I would like to see if the great midwest drought was  
14 on their minds in 2012 and then not realizing 2013, so I'd want  
15 to do more analysis.

16   **Q.**   And did Dr. Wilner do any of that?

17   **A.**   No.

18   **Q.**   Now, to -- for a starting point -- you can take this down,  
19 Bonnie. Thank you.

20                 For a starting point, with regard to these budgets,  
21 for 2014, what budget did Dr. Wilner use?

22   **A.**   He used the budget that was put together in October or  
23 November of 2013, so it was what the company agrees on, getting  
24 the input of a variety of individuals, for what the upcoming  
25 year will be.

1   **Q.** Now, do you agree with Dr. Wilner's choice of the fall  
2   2013 budget for 2014 performance as his benchmark for  
3   calculating lost -- one of his benchmarks for calculating lost  
4   profits?

5   **A.** No. Infringing -- alleged infringing sales by Willowood  
6   didn't start until July 2014, so it was halfway into the year,  
7   not before the year began.

8   **Q.** And, in fact, after the budget was prepared, annual budget  
9   was prepared in the fall of 2013, did Syngenta update those  
10   forecasts?

11   **A.** Yes, on roughly a monthly basis it did, and there's been  
12   testimony about this latest projection or last projection, in  
13   which they continue to update the budget for what they expect  
14   that upcoming year to realize, and they certainly did that in  
15   the first part of 2014.

16   **Q.** And have you calculated how Dr. Wilner's damage estimates  
17   would change if he had used more accurate budget forecast  
18   prepared after the fall of 2013, closer to the time that  
19   Willowood entered the market?

20   **A.** Yes, I did.

21   **Q.** Have you prepared a slide that shows that analysis?

22   **A.** Yes.

23                   **MR. NEUMAN:** Bonnie, could you pull up Jarosz 10.

24   **BY MR. NEUMAN:**

25   **Q.** Does this slide show the results of that analyze that you

1 did, Mr. Jarosz?

2 **A.** Yes, it did.

3 **Q.** And can you walk the panel through what it shows, please.

4 **A.** Yes, on the far left, that darker orange bar, that shows  
5 what Dr. Wilner did. He relied on the October/November 2013  
6 budget for what would occur in 2014, and the result was his  
7 damages number of \$75.6 million.

8 If, however, you use the LPs or the updates to the  
9 budget as the time goes on, all of these are before first  
10 infringing sale, you'll see tremendous sensitivity in the  
11 damages analysis, such that the numbers drop quite  
12 dramatically, and by April -- using the April 2014 projections  
13 of revenues and gross profits, his damages model would suggest  
14 no damages, and that would be true whether you use the April,  
15 May or June LPs. The result would be a dramatic change from  
16 the number he presented to the jury.

17 **Q.** Now, is there underlying data that you looked -- or  
18 information that you looked at that is -- that supports and is  
19 reflected in Jarosz 10?

20 **A.** There's a ton, and which excites we economists, but not  
21 all human beings.

22 **Q.** And have you prepared a slide that summarizes the  
23 underlying data?

24 **A.** Yes.

25 **MR. NEUMAN:** All right. Bonnie if could pull up

1 Jarosz 11, please.

2 **BY MR. NEUMAN:**

3 Q. There's a lot of information. It's a very busy slide, but  
4 could you explain at a very high level what the information is  
5 on this chart that supports the graph that we just -- the bar  
6 chart that we just looked at.

7 A. This busy but exciting chart shows the Wilner model and  
8 the results and then adjustments over time, so you'll see under  
9 Wilner values, he started with the gross profits budget of the  
10 \$166.6 million. He made his adjustments, subtracted actuals  
11 and at the very bottom of that column you see the damages  
12 number of \$75.6 million.

13 If instead you use that same model structure and just  
14 put in the LPs or last projected models, you see the numbers  
15 change quite dramatically over time, and the bottom line  
16 numbers you see in that last row are precisely the ones that I  
17 charted in the previous demonstrative slide.

18 Q. And are all of the assumptions the same in what you've  
19 done here, other than the budget number, the same that Dr.  
20 Wilner used?

21 A. Yes, exactly the same.

22 Q. So if we could go back a slide to 10, is this further  
23 evidence of the sensitivity that you were talking about  
24 earlier, the sensitivity of the damages number to shifts in  
25 budget and accuracy?

1   **A.**   Yes, and it's also all occurring in a period before the  
2   alleged infringing sale even occurred.

3   **Q.**   Now, did you hear Dr. Wilner say that it's -- in his  
4   opinion, it's not appropriate to use the fall 2014 budget,  
5   anything after the fall 2014 budget --

6                   **THE COURT:**   Twenty what?   What year are you saying?

7   **BY MR. NEUMAN:**

8   **Q.**   Did you hear Dr. Wilner testify that it is not appropriate  
9   in his opinion to use any of the subsequent monthly forecasts  
10   to calculate damages, any of the forecasts that were prepared  
11   after the fall 2013 annual budget for 2014 was prepared?

12   **A.**   Yes, I heard that.

13   **Q.**   And do you -- and why did he say that in his view it was  
14   not appropriate to use any of those later forecasts?

15   **A.**   I think he said there was evidence of Willowood's likely  
16   entry into the business that started to seep in to Syngenta's  
17   thought processes beginning in 2014 and then going onward.

18   **Q.**   Do you agree with Dr. Wilner that that information is a  
19   sufficient basis to say we should not use monthly LPs that were  
20   prepared after the fall of 2013?

21   **A.**   No. He didn't present any evidence that, in fact, that  
22   was the case, that evidence of Willowood's likely entry was  
23   first known in 2014. Moreover, he didn't have an explanation  
24   for why the gross profits projections or forecasts kept going  
25   down month to month because he didn't have any particular new

1 information that was -- that he pointed to that seeped in that  
2 change from January to February, and then some new information  
3 from February to March, and new information from April to May.  
4 It continued to fall, but he didn't point to particular  
5 evidence that was confirming that Syngenta was now only  
6 learning of Willowood and its knowledge was changing every  
7 single month.

8 **Q.** Well, did you hear the testimony presented by some of  
9 Syngenta's fact witnesses about what they were hearing, what  
10 they say they were hearing in the last month of 2013 and early  
11 2014 on that score?

12 **A.** I heard evidence on that, yes; and, again, I didn't see  
13 any confirmation, but I heard they were hearing about it, but I  
14 didn't hear testimony about when they first heard about it or  
15 thought about Willowood.

16 **Q.** And how would you -- how would you describe the quality  
17 and quantity of that information in terms of a basis to not use  
18 those later budget forecasts?

19 **A.** If I were putting together a model that derived these kind  
20 of numbers, I would want to investigate that a little bit more  
21 to see what that evidence was, how much of it there was, and  
22 how reliable that evidence was, and I didn't see that.

23 **Q.** Was there any evidence presented as to how the information  
24 that was obtained by Syngenta translated into specific  
25 reductions in their budget forecast month to month?

1   **A.**   No. I didn't hear any on that.

2   **Q.**   Now, do you believe that there is a more plausible  
3 explanation for why these monthly LPs were decreasing generally  
4 month over month after preparation of the fall 2013 annual  
5 budget?

6   **A.**   Yes. The business for the farmers was becoming very  
7 difficult in early 2014, and that had nothing to do with  
8 Willowood.

9   **Q.**   And in that regard, what -- have you seen evidence as to  
10 what Syngenta expected with respect to that factor, when it  
11 prepared its budget in late 2013?

12   **A.**   Yes. In its budget, and the materials around it, it said  
13 is suspected strong commodity prices, that they would continue  
14 strong and, in fact, they were not right. Now, I should  
15 explain the commodity prices, just so we're in agreement.

16                 Farmers sell crop and they generate commodity prices,  
17 in other words, something is paid per bushel for wheat or corn  
18 or soybean. So when we're talking about commodity prices, it's  
19 the money that comes into the farmers. When we're talking  
20 about azoxystrobin, that's a cost. They need to put that on  
21 their crops to ultimately sell their crops.

22                 So the difference for a farmer between what it can  
23 realize in sales and what it costs to run a farm, is its  
24 margin. And what we see here is what it realizes through the  
25 commodity prices, came down dramatically over time, and so that

1 really pinched farmers and their ability to incur costs, and so  
2 when they think about buying more azoxystrobin, they realize  
3 the margins, or the profits, have really been squeezed and they  
4 think long and hard about whether they want to pay Syngenta  
5 prices for the fungicides.

6           **MR. NEUMAN:** Bonnie, could you put up Slide 12.

7           **BY MR. NEUMAN:**

8           **Q.** Mr. Jarosz, does this slide depict any of the trends that  
9 you were talking about in terms of commodity pricing?

10          **A.** It does.

11          **Q.** Could you explain to the jury what this slide shows.

12          **A.** That blue line I tracked what the corn prices were.  
13 That's one of the commodity prices. That's what farmers  
14 realize. They sell corn, and they realize a price on that  
15 corn. You'll see that it was fairly steady in the first part  
16 of 2014, and then suddenly the market changed dramatically, so  
17 Syngenta, predicted strong commodity prices but, in fact, that  
18 wasn't right. You'll see it fell from over an \$135 per bushel,  
19 down to less than \$105, so things really fell.

20           Not surprisingly, there was --

21           **THE COURT:** Wait a minute. What?

22           **BY MR. NEUMAN:**

23          **Q.** Mr. Jarosz, I'm sorry, you may have misspoken. Which axis  
24 is the price per bushel on?

25          **A.** It's on the right axis. Oh, I'm sorry. You're absolutely

1 right. I misspoke. It was \$4.70 per bushel. Thank you, Your  
2 Honor.

3           **THE COURT:** All right. I'm easily confused  
4 sometimes. Go ahead.

5           **THE WITNESS:** And I'm the one who said I get excited  
6 about data so I --

7           **THE COURT:** Go ahead. What's your question?

8           **THE WITNESS:** \$4.70 per bushel, it fell down to less  
9 than \$3.60 per bushel. And shortly thereafter, the  
10 azoxystrobin prices fall in a similar kind of pattern. The  
11 azoxystrobin prices realized by Syngenta fall from the prices  
12 that I gave just a moment ago; from about \$135 per gallon down  
13 to about \$105 per gallon.

14           So corn prices were very much impacting and, in fact,  
15 what we economists call a leading indicator for azoxystrobin  
16 prices, when corn prices fell, azoxystrobin was less attractive  
17 and those prices had to fall.

18           **BY MR. NEUMAN:**

19           **Q.** And when did azoxystrobin -- just to be clear, the blue  
20 line is the decline in corn prices, and when did the dramatic  
21 drop occur that you're referring to?

22           **A.** Between March and August of 2014.

23           **Q.** And when did Syngenta then react with corresponding drop  
24 in its price of azoxystrobin?

25           **A.** About six months later, at the end of 2014.

1   **Q.** Now, you testified earlier that for years after 2014, Dr.  
2 Wilner used actuals versus his adjusted forecast, the forecast  
3 he thought that Syngenta should have made, right?

4   **A.** Yes, that's right.

5   **Q.** All right. Is that actually true for how he calculated 15  
6 plus million dollars in damages for the year 2017?

7   **A.** No. For 2017, he didn't have any data, and of course not,  
8 he did his report in 2016 so there were no 2017 data. So he  
9 said the forecast for 2017 will be what the LP was for January  
10 of 2016, and he said the actual for 2017 will be the LP for  
11 July of 2016. So he picked up observations from 2016 and put  
12 those into 2017 to come up with his damages estimate.

13   **Q.** And at that point in time, in mid-2016, did he have any  
14 actual sales data for 2017?

15   **A.** No. In fact, he didn't even have actual sales data for  
16 2016.

17   **Q.** Has Dr. Wilner attempted to test the accuracy of  
18 Syngenta's azoxystrobin budget forecasting?

19   **A.** Not to my knowledge.

20   **Q.** Now, please refer to Wilner -- Dr. Wilner's demonstrative  
21 Exhibit 52.

22                   Bonnie, if you could bring that up.

23                   Do you recall some testimony by Dr. Wilner about his  
24 use of this chart, as you can see in the heading, validation of  
25 calculations?

1   **A.**   Yes, I think he did that near the end of his testimony.

2   **Q.**   And what do you understand Dr. Wilner to have said about  
3 why this chart validates his calculations?

4   **A.**   Well, he said, look at the difference between the yellow  
5 line where I have an arrow, and the red line where I have an  
6 arrow, and those are pretty close. Therefore, the company must  
7 be pretty good at budgeting.

8   **Q.**   Do you agree --

9   **A.**   And, in fact --

10   **Q.**   I'm sorry, go ahead.

11   **A.**   In fact, what you see in 2015 is his estimate of what the  
12 budget should have been, and if you look in other years, it's  
13 not very close at all. So if you look at 2015, versus 2016,  
14 the yellow versus the red, that's off by quite a bit.

15                 If you look at 2016 versus 2017, the yellow versus  
16 the red is off by quite a bit, so he picked one year where  
17 things looked close, and they are close, but remember, he  
18 created 2015, so he created it to look close.

19   **Q.**   Sir, could you please sum up your criticisms of Dr.  
20 Wilner's use of the azoxystrobin sales forecasting as a  
21 foundation for his lost profits analysis?

22   **A.**   Yes. He relied on budgets which have been shown to be  
23 inaccurate. They have been off for quite a number of years.  
24 He relied on a budget that was done before the first alleged  
25 infringing sale in July of 2014, and he didn't go back to test

1 to see how well the azoxystrobin budget, in fact, predicts  
2 actual performance by looking at pre-2009 projections, for  
3 instance, or looking to see how the process is undertaken to  
4 see whether his one off explanations are enough or whether, in  
5 fact, Syngenta's budgeting is imprecise.

6 **Q.** Let's turn to the second main critique you have of Dr.  
7 Wilner's lost profits analysis, which was his use of Syngenta's  
8 mesotrione budgeting as a benchmark to adjust the azoxystrobin  
9 budgeting. Could you remind us of how Dr. Wilner uses those  
10 forecasts, the mesotrione forecasts in his analysis.

11 **A.** Yes. He looked at the variation from mesotrione actual  
12 versus budget and said that adjusts for all the other things  
13 going on in the marketplace other than Willowood's  
14 infringement, so let me adjust the azoxystrobin forecasts for  
15 that difference, because that will pick up impacts that I need  
16 to pick up.

17 **Q.** Impacts other than Willowood?

18 **A.** Other than Willowood, yes.

19 **Q.** So for Dr. Wilner's analysis to be reliable, would it also  
20 be important for Syngenta's forecasting of mesotrione sales to  
21 be accurate just like for its forecast of azoxystrobin sales?

22 **A.** Absolutely, because the way it works is -- the way he uses  
23 it is he said if the mesotrione actual is 80 percent of the  
24 mesotrione budget, then we should expect that the azoxystrobin  
25 actual would be 80 percent of the azoxystrobin budget. So the

1 accuracy of the mesotrione budget is critical because that  
2 defines whether it's 80 percent off or something different.

3 **Q.** Was Syngenta's annual forecast budgeting of mesotrione  
4 sales accurate?

5 **A.** No. They had similar difficulties in forecasting  
6 associated with mesotrione.

7 **Q.** Did you prepare a slide that demonstrates that?

8 **A.** Yes.

9 **Q.** Bonnie, if you could pull up Jarosz 13. Does this slide  
10 show what you were just describing about their budget  
11 forecasting for mesotrione?

12 **A.** Yes.

13 **Q.** What does it show?

14 **A.** This looks at just mesotrione, as opposed to what I looked  
15 at before, which was just azoxystrobin, and you'll see there's  
16 quite a bit of variation between budget and actual for  
17 mesotrione. You'll see in 2012 and 2013 before anything  
18 happened that the budget was off by 23.8 to 29 percent. So  
19 that's quite a bit of variation just in the mesotrione, and  
20 it's in a different direction from what we saw the azoxystrobin  
21 problems, and even in 2014 it was off by 15.4 percent. So this  
22 is a difficult business to forecast, and the numbers here show  
23 that difficulty.

24 **Q.** Now, Dr. Wilner -- thank you, Bonnie.

25 Now, Dr. Wilner also says that mesotrione is so

1 similar to azoxystrobin itself that it's appropriate to use  
2 mesotrione as a benchmark that accounts for factors other than  
3 Willowood. Do you agree that mesotrione is sufficiently  
4 accurate as a benchmark?

5 **A.** No, it's not sufficiently accurate. There are fundamental  
6 differences between mesotrione and azoxystrobin that would  
7 suggest that their performance wouldn't necessarily move in the  
8 same direction.

9 **Q.** Now, Dr. Wilner says that azoxystrobin and mesotrione are  
10 sufficiently similar, in part, because Syngenta lost exclusive  
11 right over -- rights over both of those molecules at about the  
12 same time in 2014, and, therefore, both would start to face  
13 generic competition at roughly the same time. Do you agree  
14 with that?

15 **A.** No. It's factually not quite accurate because though data  
16 exclusivity was lost from mesotrione in 2014, there's been  
17 testimony that about 88 percent of mesotrione is used in  
18 mixtures that are covered by other patents. So there was still  
19 patent coverage that was standing in the way of mesotrione  
20 succeeding in the marketplace. That was not the case for  
21 azoxystrobin.

22 **Q.** Did you also hear testimony that in 2014 BASF's patent for  
23 its strobilurin product, its equivalent to azoxystrobin, came  
24 off patent in 2015?

25 **A.** Yes, I did.

1   **Q.**   And do you recall testimony that in anticipation of that  
2   event, BASF increased the amount significantly of its  
3   strobilurin product that it would sell in the market in 2015?

4   **A.**   Yes, and that exerted price pressure.

5   **Q.**   On which product?

6   **A.**   On the azoxystrobin product.

7   **Q.**   And would one expect that that action, that event, would  
8   exert a similar downward price pressure on mesotrione?

9   **A.**   No.

10   **Q.**   Now, mesotrione is a herbicide, correct?

11   **A.**   It is.

12   **Q.**   And azoxystrobin is a fungicide?

13   **A.**   Yes.

14   **Q.**   Would that difference matter in terms of farmers  
15   purchasing decisions and farm economics?

16   **A.**   Absolutely. There's been a lot of testimony on that in  
17   many documents. The mesotrione, being a herbicide, deals with  
18   weeds. Azoxystrobin, being a fungicide, deals with fungal  
19   disease or diseases. They treat very different things, and the  
20   importance of treating weeds is different from the importance  
21   of treating disease.

22   **Q.**   And how does that affect demand and predictability for  
23   those two products?

24   **A.**   Mr. Heinze talked about this issue, as did other witnesses  
25   here. Weeds are always a problem. Farmers always have to

1 address that problem, and so there's not nearly as much  
2 elasticity or variation in prices associated with herbicides  
3 because farmers need to buy the product. Fungicides that treat  
4 disease, that's less substantial of a problem. And so in tough  
5 times, farmers can and do cut their expenditures of fungicides  
6 and azoxystrobin, in particular, because they don't have to  
7 treat diseases in the same way that they have to treat the weed  
8 problems.

9 **Q.** And you said you heard that sort of testimony from  
10 Mr. Heinze. Do you have any other information in evidence that  
11 you have reviewed in this case that indicates that that's so?

12 **A.** There are many Syngenta presentations that talk about that  
13 precise topic.

14 **Q.** Have you taken a look at how mesotrione actually performed  
15 year to year -- mesotrione sales actually performed year to  
16 year compared to azoxystrobin sales?

17 **A.** Yes. In particular, I looked to see the performance  
18 versus budget for both of the products, and I focused on gross  
19 profits.

20 **Q.** Could you please take a look at Jarosz 14. Bonnie, could  
21 you bring up Jarosz 14. Can you explain what this slide shows,  
22 Mr. Jarosz.

23 **A.** Yes, this shows that mesotrione and azoxystrobin react  
24 very differently in the marketplace, the actual performance  
25 versus the budget performance. So in 2012, for instance,

1 azoxystrobin was within 3 percent of the budget; yet,  
2 mesotrione was 29 percent. So it was wildly off. In the next  
3 year, 2013, mesotrione was 24 percent too high; yet,  
4 azoxystrobin was 18 percent too low.

5 And so you'll see two of the four years, 2013 and  
6 2015, they move in opposite directions. In other words, budget  
7 is less than actual for one, but more than actual for the  
8 other; and in neither -- in none of the years do they track  
9 each other very closely. In other words, azoxystrobin  
10 variations from budget are very different from mesotrione  
11 variations from budget. So for Dr. Wilner to use the  
12 mesotrione budget variance as an estimator for azoxystrobin  
13 seems to conflict with how they actually perform.

14 **Q.** Now, this chart shows a comparison of the actual sales  
15 results for these two products. Did you also look at how, if  
16 at all, Syngenta's budgeting decision-making indicates  
17 differences between how they budget for mesotrione as opposed  
18 to azoxystrobin?

19 **A.** Yes, I did.

20 **MR. NEUMAN:** Bonnie, could you please pull up slide  
21 15. I'm sorry, 16. Beg your pardon. May I have a moment,  
22 Your Honor?

23 **THE COURT:** Okay.

24 **MR. NEUMAN:** How about 15.

25 **BY MR. NEUMAN:**

1   **Q.**   What does this slide show?

2   **A.**   I attempted to see if mesotrione and azoxystrobin are  
3 impacted in the same way in the marketplace. Do they track  
4 each other in Syngenta's eyes? And what I saw is, that they do  
5 not. What I tracked here is azoxystrobin's budget versus its  
6 actual performance from the previous year, and I did that for  
7 mesotrione as well.

8                 So if they move together, reacted to the same kinds  
9 of things in the same ways, I would have expected those bars to  
10 be pretty similar to each other, but they're not. Even before  
11 any alleged infringement occurs, you'll see in 2013 the company  
12 put the azoxystrobin forecast 14 percent above the actual  
13 performance from the prior year, but mesotrione was held  
14 constant. Similarly, for 2014. Azoxystrobin was put  
15 16 percent up, but mesotrione was only 1 percent up. And  
16 similarly in the later years.

17                 So you'll see that Syngenta views them as reacting to  
18 different dynamics in the marketplace. They are not  
19 sufficiently comparable.

20   **Q.**   You've heard reference to the phrase "untreated acres"?

21   **A.**   Yes I have.

22   **Q.**   Now, does that factor affect the demand for herbicides and  
23 fungicides differently?

24   **A.**   Yes, absolutely, and Syngenta documents talk about  
25 untreated acres quite a bit. In fact, for azoxystrobin they

1 call "untreated acres" the biggest competitor.

2 **Q.** And what's the implication of that for sales of  
3 azoxystrobin and the potential effect of generic competition?

4 **A.** It goes back to what I discussed a few moments ago. When  
5 times are tough, farmers can and do decide not to treat their  
6 crops with azoxystrobin or any fungicide. And when the prices  
7 are too high, they decide not to treat their crops with  
8 azoxystrobin. That's not the case with -- not as much the case  
9 with regard to herbicides. Farmers treat herbicides. They  
10 need to because weeds are a problem year in and year out. They  
11 don't always treat fungicides.

12 So, by way of example, from 2013 to 2014, when the  
13 commodity prices are really falling down, mesotrione sales go  
14 up; yet, azoxystrobin sales go down. And I would expect that,  
15 because when times are tough or prices or too high, farmers  
16 won't spend for azoxystrobin or other fungicides.

17 **Q.** Could you please put up Jarosz Slide 16.

18 Does this slide relate to what you were just talking  
19 about, Mr. Jarosz?

20 **A.** It is.

21 **Q.** And what does it show?

22 **A.** I show, again, two axes on the left-hand side. I show  
23 azoxystrobin -- I'm sorry. On the left-hand side, I show net  
24 farm income. That's the blue line. And, again, as I  
25 described, as I showed with my hands before, net farm income is

1 the difference between the prices that farmers are able to  
2 obtain and the cost that they incur. When things are good,  
3 that's a big spread. But you'll see over time, farm income  
4 came down, it was pinched; and as a result, not surprisingly,  
5 azoxystrobin sales fall. That's what's shown in the orange  
6 line, that -- associated with the big drop in farm income from  
7 2003 onward, azoxystrobin prices fell as well, and that's  
8 regardless of whether Willowood is in the marketplace or not.

9 **Q.** Thank you, Bonnie.

10 Let's talk about your third main critique of  
11 Dr. Wilner's lost profits analysis, which, as I understood it,  
12 was his assumption that other generics were insignificant  
13 compared to Willowood in the market place. Is that a fair  
14 summary of your critique?

15 **A.** Yes, I think so.

16 **Q.** Now, who was the first generic azoxystrobin producer  
17 distributor into the market?

18 **A.** Cheminova.

19 **Q.** I beg your pardon?

20 **A.** Cheminova.

21 **Q.** And in 2014 and 2015 in terms of azoxy sales, how big were  
22 Cheminova's -- withdrawn. Was there another generic market  
23 entrant in 2014?

24 **A.** Well, there was Willowood and Albaugh. So there were  
25 three entrants in 2014.

1   **Q.**   And in 2014 and 2014 (sic), how big were Cheminova and  
2   Albaugh sales compared to Willowood?

3   **A.**   I assume you're talking about 2014 and 2015?

4   **Q.**   Fifteen, yes. I beg your pardon.

5   **A.**   Collectively, they're quite small. They are a small  
6   sliver of Syngenta sales. But the sum of Cheminova and Albaugh  
7   is as large as Willowood, and I think I have a demonstrative  
8   slide on that.

9   **Q.**   Bonnie, could you put up Jarosz 17.

10                 So just very quickly, Mr. Jarosz, just go through  
11   this slide for the jury.

12   **A.**   I plotted there the shares associated with azoxystrobin  
13   technical. You'll see that Syngenta and its partners comprise  
14   about 91 percent of business. Willowood has about 4 1/2  
15   percent. Cheminova and Albaugh for those two years have about  
16   2 percent each. So they sum up to having a larger presence in  
17   the business in those two years than Willowood, although all of  
18   them are fairly small.

19   **Q.**   So did it make sense to you to simply write off the  
20   relative significance of Albaugh and Cheminova in relation to  
21   Willowood?

22   **A.**   No. They're just as significant; and if Willowood were  
23   gone, not in the market, I have a hard time imagining Cheminova  
24   and Albaugh wouldn't be more aggressive and more successful,  
25   because there would be a market opportunity for them.

1   **Q.**   What did Dr. Wilner assume on that point?

2   **A.**   In his base case, he assumed that Cheminova and Albaugh  
3 had no impact on Syngenta, that all of the impact came from  
4 Willowood. In essence, he wrote that Albaugh and Cheminova in  
5 his base case would probably have left the market if Willowood  
6 had left the market.

7   **Q.**   So in a but-for world, if those generics had acted more  
8 aggressively and made the sales that Willowood would have  
9 otherwise made, what does that say about the damages caused by  
10 Willowood's alleged early market entry?

11   **A.**   That there would be no damages because Albaugh and  
12 Cheminova would fill in the void, and one would expect that, if  
13 Willowood were gone, that those companies would come in and  
14 continue to compete aggressively and have the same impact on  
15 Syngenta that the three of them collectively had.

16   **Q.**   And I'm sorry. I may have spoken some jargon. I asked  
17 you in the but-for world. Could you explain what the but-for  
18 world is?

19   **A.**   A world in which there's no infringing activity. In  
20 Dr. Wilner's mind, that's a world in which Willowood does not  
21 participate in this business.

22   **Q.**   You're familiar with Syngenta's brand ladder that's been  
23 discussed in this case by several witnesses?

24   **A.**   Yes, I am.

25   **Q.**   Bonnie, could you put up Dr. Wilner's slide 12.

1                   Now we've all seen this brand ladder several times.

2 How do you understand Dr. Wilner to have used this brand  
3 ladder?

4 **A.** In essence, he said, any impact for any rung on the ladder  
5 impacts all of the other rungs. So even though Willowood  
6 competes directly with Quadris and Quilt Xcel, the impacts of  
7 that competition would run all up and down the ladder so that  
8 the entire portfolio of Syngenta azoxystrobin products would be  
9 impacted.

10 **Q.** Do you agree with how Dr. Wilner used the brand ladder to  
11 calculate damages?

12 **A.** No, I have a conceptual problem and a practical problem.

13 **Q.** Could you explain, please?

14 **A.** The conceptual problem is -- I think he talked about it,  
15 and maybe Mr. Cecil talked about it. The idea of a brand  
16 ladder or brand pyramid was first introduced by Alfred Sloan a  
17 hundred years ago in dealing with GM.

18                  **THE COURT:** In dealing with what?

19                  **THE WITNESS:** GM, General Motors.

20                  **THE COURT:** All right.

21                  **THE WITNESS:** And he built out this concept whereby  
22 Oldsmobile and Buick and Chevrolet wouldn't compete with one  
23 another because those were all GM brands but would inhabit  
24 slightly different marketplaces, or segments. He wanted to  
25 foster the idea that the company shouldn't be cannibalizing, or

1 taking sales away from itself, but should be developing new  
2 marketplaces and going out and competing differently.

3                   And so, specifically, what the brand ladder concept  
4 says is, let's segment our different solutions to different  
5 segments of the business so that we don't steal from one  
6 another. As a result, we also won't feed off one another.  
7 We're going to different parts of the market. So,  
8 specifically, as set up, the brand ladder does not suggest that  
9 all these rungs move together, but there are simply different  
10 rungs for different segments.

11 **Q.** That's your conceptual problem?

12 **A.** Yes.

13 **Q.** What's the practical problem?

14 **A.** The practical problem is that I asked myself, well, do the  
15 Syngenta products actually move up? Do the rungs move  
16 together? When there are price changes for Quadris and Quilt  
17 Xcel, historically, has it been the case that there have been  
18 similar price changes for the other products on the brand  
19 ladder? And I created a demonstrative that reflected my  
20 results.

21                   **MR. NEUMAN:** Bonnie, could you please pull up Jarosz  
22 18?

23 **BY MR. NEUMAN:**

24 **Q.** Is this demonstrative that you were referring to?

25 **A.** Yes.

1   **Q.**   Could you explain what this demonstrative shows?

2   **A.**   What I have charted in the red bars is price changes for  
3 Quilt Xcel and Quadris from the previous year. What I've  
4 charted in the other colors is other products on this so-called  
5 brand ladder.

6                 I would have expected, if you think the rungs all  
7 move together, that Quilt Xcel and Quadris, which is what  
8 Willowood has been competing with, that they would move  
9 together, or roughly together, and that so would the other  
10 products. But, in fact, you can see it's all over the place.

11                 So, in 2014, for instance, Quilt Xcel and Quadris  
12 prices go down, yet Quadris Top SB abound, Quadris Top and  
13 Avaris all go up. The rungs aren't moving together.  
14 Similarly, with regard to the 2016 June year-to-date, in fact,  
15 Quadris and Quilt Xcel move in opposite directions. They don't  
16 even move together when they're on the same rung. And the  
17 other products, some go up, some go down.

18                 So it doesn't appear as if these rungs are moving  
19 together. They -- it appears to be the case that each product  
20 is responding to the specifics of the marketplace that that  
21 that product fixes.

22   **Q.**   Thank you, Mr. Jarosz. You can take this slide down now,  
23 Bonnie.

24                 Now, did you hear Dr. Wilner offer up an alternative  
25 damages number of roughly \$34 million in the event that,

1 despite his opinion, Cheminova were deemed to be -- have an  
2 effect on the market?

3 **A.** Yes, I did.

4 **Q.** Do you have an opinion as to that number?

5 **A.** I do.

6 **Q.** What is it?

7 **A.** It suffers from the same flaws as the original number  
8 does, the problems in forecasting, the problems with using  
9 mesotrione, the problems with generic competition still being  
10 there. In particular, on this last point, he says, Albaugh and  
11 Cheminova and the other generics would, in his calculation,  
12 only be as strong as they were historically.

13 Well, that overlooks the fact that if Willowood is  
14 gone, those companies are likely to be aggressive and fill the  
15 void that's been missing with -- coming from generic  
16 competition. Why would Cheminova and Albaugh just give this  
17 market away when they had a good, strong presence? I'd expect  
18 it's more reasonable that they would continue to fight, and  
19 that continued fight would have the same impacts on Syngenta as  
20 historical, because remember, Syngenta is responding to generic  
21 competition throughout its documents.

22 **Q.** Thank you, Mr. Jarosz. I'd like to talk to you now about  
23 your reasonable royalty calculations.

24 **THE COURT:** I think, before we do that, let's take  
25 our morning break. All right. Ladies and gentlemen, I'll

1 excuse you for 15 minutes. Please don't talk about the case  
2 among yourselves or form any opinion. Avoid contact with the  
3 lawyers, parties, or witnesses, and come back in 15 minutes.  
4 Leave your notes. The jury is excused.

5 (At 11:00 a.m., jury excused.)

6           **THE COURT:** Okay. So I want to return to the '138  
7 patent and the testimony that was on the -- we talked about  
8 this before the jury came in this morning in the context of  
9 Dr. Wilner's deposition testimony about what Dr. Whitton told  
10 him. When I saw this slide, No. 6, in the Defendant's  
11 demonstrative here, it just sort of hit me in the face again,  
12 and I don't like to overrule myself, but I just want to revisit  
13 this, because I don't understand how this witness can testify  
14 about a reasonable royalty based on available non-infringing  
15 options, when there's no evidence of non-infringing options.

16           So, can you explain that to me?

17           **MR. NEUMAN:** I can explain that that is an error and  
18 that should have come out of that slide.

19           **THE COURT:** Okay.

20           **MR. NEUMAN:** It should just -- it should not say  
21 that.

22           **THE COURT:** It should not say that?

23           **MR. NEUMAN:** That's correct.

24           **THE COURT:** All right. Okay.

25           **MR. SANTHANAM:** Well, Your Honor, it's not just with

1 respect to the '138, but also the '761. So, in the slide deck  
2 before you, Slides 19, 20, 21, 22, and 23, all of these are  
3 based on these bare numbers of 40 percent, 50 percent that have  
4 no foundation in the record. And if -- Slide 22 also has a  
5 deposition excerpt, and that's with respect to the '761 patent.

6           **THE COURT:** Okay. Well, I'm more concerned about the  
7 '138 patent. I mean, I don't -- Slide 21 also  
8 references -- no, that's the '761 patent. Let me look. Slide  
9 19 also references incremental costs of non-infringing  
10 alternative to the '138 patent.

11           **MR. NEUMAN:** And the witness can explain that he is  
12 not -- he has no opinion as to whether there is a  
13 non-infringing alternative, that what he means by that is that  
14 based on what he has heard in a hypothetical negotiation,  
15 Syngenta would be of that view.

16           **THE COURT:** Would be of what view?

17           **MR. NEUMAN:** That there is -- that there is another  
18 alternative because they have testified that to do it without  
19 using that patent would cost an extra 50 percent.

20           **MR. SANTHANAM:** Your Honor, there's been no  
21 foundation of that at all.

22           **THE COURT:** I'm having trouble understanding how this  
23 is helpful to the jury when the jury has no evidence of that.  
24 I mean, the jury has to calculate the -- set the reasonable  
25 royalty.

1           **MR. NEUMAN:** Yes.

2           **THE COURT:** And they have to have a basis for that.

3 So --

4           **MR. NEUMAN:** And Dr. Wilner will testify that --

5           **THE COURT:** Doctor who? Who will testify?

6           **MR. NEUMAN:** I mean, Mr. Jarosz will testify that  
7 based upon the information provided by Dr. Whitton to  
8 Dr. Wilner, that, in a hypothetical negotiation, Syngenta would  
9 take the position that there's a 50 percent mark-up on the use  
10 of something other than the '138 patent. It provides the  
11 starting point for the hypothetical negotiation.

12          **THE COURT:** Okay. So you're using different words,  
13 because what's on these -- what's on the slide says,  
14 non-infringing alternative.

15          **MR. NEUMAN:** That's correct.

16          **THE COURT:** But there's no evidence of a  
17 non-infringing alternative for the jury to take into account.

18          **MR. NEUMAN:** And doctor -- and Mr. Jarosz will not  
19 opine as to the existence of a non-infringing alternative.

20          **THE COURT:** Okay. But, if there's no evidence of a  
21 non-infringing alternative, how can he use that as the basis  
22 for his calculations?

23          **MR. NEUMAN:** Because there is information about what  
24 Syngenta believes the cost would be -- incremental costs would  
25 be to not use the '138 patent. He's not opining that there is

1 an alternative available. He's using that as the basis for  
2 where Syngenta would start in the negotiation.

3           **THE COURT:** Okay. So --

4           **MR. NEUMAN:** He's agnostic on whether or not there  
5 actually is an available alternative.

6           **THE COURT:** Okay. So, I'm sorry. Sometimes, I'm  
7 just a little slow about these things. You are not going to be  
8 contending that there was a non-infringing alternative  
9 available for the '138 patent when one is evaluating lost  
10 profits?

11           **MR. NEUMAN:** Correct.

12           **THE COURT:** Okay. Thank you for helping me  
13 understand that.

14           **MR. SANTHANAM:** Well, Your Honor, the non-infringing  
15 alternative is the basis for his reasonable royalty as well.  
16 The number of 30 or 40 percent, the number of 10 or 15 or 20  
17 percent, all of those numbers, those percentages, there's no  
18 foundation for it in the record.

19           They had the opportunity, if they wanted, to ask  
20 Dr. Whittom. They had the opportunity to ask Dr. Wilner. And  
21 what they're essentially trying to do is put forth facts,  
22 underlying facts under Rule 703 for which there's no basis in  
23 the record. And, if anything, it would confuse the jury under  
24 Rule 703. And under that standard, the prejudicial value far  
25 outweighs the probative value, and it should be the opposite

1 under Rule 703.

2           **THE COURT:** Anything else you want to say?

3           **MR. NEUMAN:** There are many factors that affect a  
4 hypothetical negotiation. This is one of them.

5           **THE COURT:** All right. Let me think about it a  
6 little bit over the break. So we will take a seven-minute  
7 recess.

8                         (At 11:06 a.m., break taken.)

9                         (At 11:21 a.m., break concluded.)

10           **THE COURT:** Okay. Well, I tried to figure this out  
11 again and remembered what I thought about it at the time. I'm  
12 really a little confused here. Dr. -- what Dr. Whitton said to  
13 Dr. Wilner is an admission, so it's clearly admissible, if it  
14 were ever offered, but, of course, it's not in evidence yet.  
15 We don't have any of that. And it can't come in through this  
16 witness because he didn't hear the admission.

17           So, you know, Rule 703 if it -- talks about if it is  
18 inadmissible. Well, I mean, that doesn't exactly cover this  
19 situation. It's more of a facts-not-in-evidence argument, as I  
20 understand it from Syngenta. But there's lots of underlying  
21 facts in this case about these budgets and otherwise, and it  
22 just seems to me the best thing to do is to let the jury  
23 decide.

24           And it's fine for this witness to say that he  
25 used -- he used these percentages or numbers based on his

1 understanding of what Dr. Whitton told Dr. Wilner, but we're  
2 not going to go into the specifics of those statements because  
3 they're not in evidence. I mean -- and you haven't offered  
4 them into evidence. So I'm going let him testify about it, but  
5 it's not a workaround to get that into evidence substantively,  
6 because it doesn't qualify. He can't testify about what  
7 Dr. Wilner was told by Dr. Whitton because he doesn't know.

8 So he can testify about his opinion, and he can  
9 explain that he based it on what he read in Dr. Wilner's  
10 deposition about what Dr. Whitton said, but he just can't  
11 repeat the specifics. Have I said that -- I tried to say it  
12 two or three different ways. I hope I said them all  
13 consistently.

14 **MR. NEUMAN:** I think so, Your Honor.

15 **THE COURT:** All right. Bring the jury in.

16 **MR. SANTHANAM:** Your Honor, momentarily?

17 **THE COURT:** Yes.

18 **MR. SANTHANAM:** We did have one issue. Last night,  
19 we had -- they had exchanged the demonstrative slides. We had  
20 objection to one of the slides which had Syngenta on it -- a  
21 reference to Mr. Jarosz having worked previously with Syngenta.  
22 We understood from counsel for Willowood right before testimony  
23 started that they were going to remove that slide, but  
24 Mr. Jarosz has made a couple of references to his prior work  
25 for Syngenta, and we would ask that he not be allowed to

1 | continue to use that under Rule 404(3) and 404(a).

2                   **THE COURT:** I assume there's not going to be any more  
3 testimony about it.

4 MR. NEUMAN: There will no more testimony about it.

5 | The slide actually had more information --

6 THE COURT: All right. Come on in.

7 (Jury present at 11:26 a.m.)

8                   **THE COURT:** Okay. I believe we are ready to continue  
9 with the direct examination.

10 | MR. NEUMAN: Thank you, Your Honor.

11 THE COURT: Everybody is seated. You can go ahead.

12 | BY MR. NEUMAN:

13 Q. Mr. Jarosz, let's talk about reasonable royalty. Has  
14 Dr. Wilner offered any opinion about a reasonable royalty  
15 damage number in this case?

16 A. No, he has not.

17 Q. Have you calculated reasonable royalties?

18 A. Yes, I have.

19 Q. Can you describe for the jury generally what the approach  
20 would be to determine reasonable royalties?

21 A. As I said earlier, a reasonable royalty can be thought of  
22 as a license fee that should be paid for use of certain patent  
23 rights. The way we typically determine what that license fee  
24 or reasonable royalty rate or damages should be, is we use  
25 something called a hypothetical negotiation of construct --

1                   **THE COURT:** I'm actually having a little trouble  
2 hearing you. I don't know if the mic is not working quite  
3 well, or if you just lowered your voice. So if you could speak  
4 up a little bit.

5                   **THE WITNESS:** Okay. Would you like me to repeat --

6                   **THE COURT:** No, no, go ahead.

7                   **THE WITNESS:** What's used is this hypothetical  
8 negotiation construct. We assume that the two parties would  
9 have sat down at a bargaining table; and instead of Willowood  
10 presumably infringing the patents, we try to determine what  
11 should have been the outcome of a negotiation between Syngenta  
12 and Willowood. So what would a license have looked like, and  
13 what would have been the terms of the payment under that  
14 license?

15 **BY MR. NEUMAN:**

16 **Q.** And have you done that assessment in this case?

17 **A.** Yes, I have, and I've done that by assuming, as we do,  
18 that at this bargaining table the patent rights are assumed to  
19 be valid and infringed. The jury may not find that; but for  
20 this analysis, I assume that's the case. And what we're trying  
21 to figure out through this negotiation is what is the value of  
22 the patented inventions and only the patented inventions and  
23 how much should be paid for that? And a very good way to  
24 determine the value of a patented invention is to find out how  
25 much it would cost to do something that's not infringing, but

1 still accomplishes the same thing. So what's the cost of an  
2 alternative, and maybe that differential is a fair reasonable  
3 royalty rate.

4 **Q.** And could you tell the jury again what you concluded was a  
5 fair and reasonable royalty for the compound patents.

6 **A.** That is \$0, because -- or nominal amount. Ms. Kay talked  
7 about this, as did Mr. Heinze, that instead of infringing the  
8 compound patents by importing this 5 kilograms of azoxystrobin,  
9 the company simply could have done the testing overseas and  
10 submitted it to the EPA, and nothing would have been lost in  
11 translation. In other words, the EPA would have approved at  
12 the same time. The product would have been rolled out at the  
13 same time. So there was -- the only cost of doing some  
14 alternative is doing the testing overseas, and Ms. Kay said  
15 that would be no higher than about \$20,000. So it's a nominal  
16 amount for the compound patents.

17 **Q.** And what was your royalty calculation for alleged  
18 infringement of the '138 patent?

19 **A.** I've laid that out in a demonstrative slide. Do you want  
20 me to tell you what that number is?

21 **Q.** Yes, please.

22 **A.** That ultimate number is \$1.4 million.

23 **Q.** And can you describe to the jury at a high level how you  
24 determine that number?

25 **A.** Yes.

1   **Q.**   Please do.

2   **A.**   Dr. Wilner spoke with Dr. Whitton -- Dr. Whitton is at  
3 Syngenta, and Dr. Wilner was deposed on this topic, so I read  
4 his deposition testimony. And Dr. Wilner said he asked  
5 Dr. Whitton what it would cost to do something different than  
6 the '138 but still accomplish the same purpose, and he said --  
7 Dr. Whitton said to Dr. Wilner, as Dr. Wilner testified, that  
8 using Scheme II, which is laid out in the patent --

9                   **MR. SANTHANAM:** Your Honor, we're going to object to  
10 this.

11                  **THE COURT:** Sustained. You need to ask your  
12 questions a different way, because I believe I said this  
13 couldn't come in that way.

14                  **MR. NEUMAN:** I understand.

15                  **BY MR. NEUMAN:**

16   **Q.**   Mr. Jarosz, can you just describe generally the steps you  
17 went through to calculate the royalty number without talking  
18 about specifics of what Mr. -- of what Dr. Whitton told  
19 Dr. Wilner.

20   **A.**   Sure. I sought to determine how much the azoxystrobin  
21 technical cost, what the costs might be if an alternative route  
22 was chosen. Then I did a Georgia-Pacific analysis. It's a  
23 very famous court case in patent litigation where I looked at  
24 various factors that would impact a hypothetical negotiation.  
25 Those factors said the number should be somewhere in the middle

1 of the range of -- under consideration. Considering what the  
2 cost savings are, I took the very high end of range, which is  
3 conservative, I then applied that to the number of pounds of  
4 technical that were imported, and that gave me my reasonable  
5 royalty number.

6 **Q.** And that number was?

7 **A.** \$1.4 million. You're talking about for the '138?

8 **Q.** Yes, thank you. And did you do a similar calculation and  
9 use a similar approach to calculate a royalty -- reasonable  
10 royalty for the alleged infringement of '761?

11 **A.** Yes, I did the exact same approach. The coverage of the  
12 period at issue is a little bit longer, so I had to adjust for  
13 that. The advantages are a little bit lower. The end result  
14 is a royalty rate that I obtained using the same process, and  
15 that resulted in royalty damages for the '761 of \$900,000.

16 **Q.** Is that in addition to the royalty that you calculated for  
17 the '138 in the event that the jury finds infringement of both?

18 **A.** Yes, those two numbers can be added together.

19                   **THE COURT:** Are you okay?

20                   **JUROR:** I need a tissue. I'm sorry.

21                   **THE COURT:** Just a second. No problem. Fall  
22 allergies for all of us. Do you need the last question and  
23 answer repeated? Yes, can you just -- let's see.

24                   **MR. NEUMAN:** Do you me to --

25                   **THE COURT:** Yes, if you could ask it again.

1 **BY MR. NEUMAN:**

2 Q. Is the \$900,000 royalty for alleged infringement of the  
3 '761 patent in addition to the \$1.4 million number that you  
4 calculated for the '138 patent in the event that both are found  
5 to have been infringed?

6 A. Yes, those are additive.

7 **MR. NEUMAN:** No further questions, Your Honor.

8 **THE COURT:** All right. Questions for Syngenta.

9 **MR. SANTHANAM:** Yes, Your Honor.

10 CROSS-EXAMINATION

11 **BY MR. SANTHANAM:**

12 Q. Good morning, Mr. Jarosz.

13 A. Good morning.

14 Q. Now, you spoke just a moment ago about reasonable  
15 royalties. When you're calculating damages in a patent  
16 infringement case, and you've said that you've done this  
17 before, the damages are what are supposed to be adequate to  
18 compensate a patent holder such as Syngenta for the alleged  
19 infringement, is that right?

20 A. Yes.

21 Q. And the reasonable royalty is the bare minimum, isn't that  
22 right?

23 A. Yes.

24 Q. And so -- and in some instances, you would agree with me  
25 that lost profits is an appropriate measure of damages,

1 correct?

2 **A.** Yes, I agree with you.

3 **Q.** And if lost profits are established, if it is established  
4 that Syngenta lost profits as result of Willowood's  
5 infringement, then those are the damages, not the reasonable  
6 royalties, isn't that right?

7 **A.** Correct. If they're properly established, yes.

8 **Q.** Now, I'd like to talk a little bit about the analysis --  
9 and before we go on, the idea of lost profits is to put the  
10 patent holder, Syngenta, back in the position it would have  
11 been until a but-for world where Willowood had not infringed,  
12 is that right?

13 **A.** Yes. I agree with that.

14 **Q.** Now, Mr. Jarosz, I'd like to talk a little bit about  
15 the -- some of the slides and the demonstratives that you put  
16 up. I'd first like to start with Slide 7 of your -- 17, excuse  
17 me.

18                   **THE COURT:** I think -- okay?

19                   **MR. SANTHANAM:** Yes.

20 **BY MR. SANTHANAM:**

21 **Q.** And Mr. Jarosz, you mentioned, when you were discussing  
22 this slide, that Willowood's share of azoxystrobin -- and these  
23 are of imports, is that right?

24 **A.** Yes.

25 **Q.** That Willowood's share of azoxystrobin imports -- I

1 believe the exact words you used was, A small sliver of the  
2 overall pie of azoxystrobin imports. Is that right?

3 **A.** Yes, I think that's right.

4 **Q.** And when we look at this chart, and you'd agree with me,  
5 the vast majority are Syngenta and Syngenta partners is that  
6 right?

7 **A.** Yes.

8 **Q.** Now, assuming that Syngenta's not competing with itself,  
9 and we remove the blue from this chart, that leaves the three  
10 entities, Willowood, Cheminova, and Albaugh, is that right?

11 **A.** If you remove all the blue, it results in the other pies.  
12 I'm not sure if you can move all of the other blue, but I'm  
13 certainly following you.

14 **Q.** Okay. And, if you just look at Willowood, Cheminova, and  
15 Albaugh, and if you look -- and you turn that into a pie of  
16 those three entities, you'd agree with me that Willowood would  
17 be more than 50 percent of that pie, is that right?

18 **A.** Yes, for that period. That wouldn't be true if you added  
19 2016, however --

20 **Q.** Well --

21 **A.** -- I think.

22 **Q.** -- Mr. Jarosz, let's take a look at that hypothetical pie.  
23 We don't have that in front of you here because you didn't  
24 generate that, but let's take a look at that hypothetical pie.  
25 One of the components of that would be Albaugh, is that right?

1   **A.**   Yes, that's right.

2   **Q.**   Now, you heard testimony -- you said that you were here  
3 observing the entire trial, is that right?

4   **A.**   Yes.

5   **Q.**   And, surely, you heard testimony about how Albaugh was  
6 only in seed care and lawn and garden; that's where their sales  
7 were observed, correct?

8   **A.**   I think I heard that much of their business is in seed  
9 care and lawn care. I don't think that was exclusive.

10   **Q.**   And you understand that Dr. Wilner's analysis, his damages  
11 calculations excluded seed care and lawn and garden, correct?

12   **A.**   Yes.

13   **Q.**   And let's talk a little bit about Cheminova. You  
14 understand that, you know, this chart was for 2014 and 2015?

15   **A.**   Yes, that's right.

16   **Q.**   And, in 2014, Cheminova didn't have corn on its  
17 EPA-approved label, correct?

18   **A.**   That's correct. But Syngenta also missed the corn growing  
19 season in 2014.

20   **Q.**   Mr. Jarosz, my question was, Cheminova did not have corn  
21 on its EPA registered label in 2014, isn't that right?

22   **A.**   Yes, I agree with you.

23   **Q.**   And you heard the testimony of a number of witnesses that  
24 if you don't have corn on your label, you can't sell your  
25 product for use on corn. Isn't that right?

1   **A.**   Yes, I agree with that.

2   **Q.**   And, as for all of 2014, Cheminova could not sell its  
3 products on corn, isn't that right?

4   **A.**   Correct. Neither did Willowood.

5   **Q.**   Well, Mr. Jarosz, my question was, For all of 2014,  
6 Cheminova could not sell its products on corn, isn't that  
7 right?

8   **A.**   Yes. I agree with you.

9   **Q.**   And, actually, even for a portion of 2015,  
10 Willowood -- Cheminova could not sell its products on corn,  
11 isn't that right?

12   **A.**   For a portion, yes.

13   **Q.**   And at some point in 2015, you heard the testimony of Brad  
14 Reichman that was read that Cheminova left the market, isn't  
15 that right?

16   **A.**   What time frame did you put on that? I'm sorry.

17   **Q.**   In 2015.

18   **A.**   Cheminova was bought by FMC.

19   **Q.**   And at that point, the testimony you heard while you were  
20 here was that Cheminova got out of the business, isn't that  
21 right?

22   **A.**   As a company, it was bought by FMC.

23   **Q.**   And they weren't selling azoxystrobin products after that  
24 point, correct?

25   **A.**   Because there was not a separate Cheminova company, that's

1 right.

2 **Q.** Well, let's talk a little bit more about Cheminova and  
3 Albaugh. You indicated, Well, if Willowood wasn't in this pie,  
4 somehow, Cheminova and Albaugh would fill their shoes. That  
5 was your testimony, is that right?

6 **A.** I didn't use those exact words, but I agree with the  
7 concept. Why would they just sit by and let the market drift  
8 away?

9 **Q.** Well, Mr. Jarosz, you haven't actually -- well, you're not  
10 a chemist, correct?

11 **A.** Correct, I am not.

12 **Q.** You haven't actually tested Cheminova's products to  
13 determine whether those products are infringing, correct?

14 **A.** Correct, and no one would want me to do that.

15 **Q.** And you haven't actually tested Albaugh's products to  
16 determine if they're infringing, correct?

17 **A.** Correct, and I'm not qualified to do that.

18 **Q.** You're not aware of any testing that Willowood's done to  
19 establish whether these products are non-infringing, correct?

20 **A.** No, I'm not aware of any.

21 **Q.** And you've heard no testimony at this trial regarding  
22 whether Cheminova and Albaugh are non-infringing, isn't that  
23 right?

24 **A.** I don't think I have. I've also not seen a lawsuit filed  
25 against them or a judgment against them for infringing.

1   **Q.**   My question was different, Mr. Jarosz.

2                 You have not heard any testimony at this trial  
3 regarding whether Cheminova or Albaugh are non-infringing?

4   **A.**   Correct. I still agree with you.

5   **Q.**   Now, I'd like to turn to Slide -- this was Slide 17. If  
6 we could go to Slide 12. Now, this was a slide that you used  
7 to say that -- and I believe your opinion was that Syngenta  
8 sales varied with corn prices. Is that right?

9   **A.**   I don't remember the exact words, but certainly, it  
10 appears that the trajectory of prices track with a lag in corn  
11 prices.

12   **Q.**   Well, Mr. Jarosz, let's talk about little bit about the  
13 axes that you chose. This was a chart that you said you  
14 prepared, is that right?

15   **A.**   Yes.

16   **Q.**   And on the left axis, you've got numbers that are in  
17 dollars per gallon that go from \$90 per gallon to \$140 per  
18 gallon, is that right?

19   **A.**   Yes.

20   **Q.**   You didn't put that from zero to 140, did you?

21   **A.**   I didn't put it from zero to 140, but I did separately do  
22 an index where I said January 2014 to 100.

23   **Q.**   Mr. Jarosz, if you could just answer my question. You did  
24 not put it from zero to 140, is that right?

25   **A.**   Correct, I did not.

1   **Q.**   And on the right-hand side, you chose to go from \$3 to  
2   \$4.80, is that right?

3   **A.**   That's right.

4   **Q.**   You didn't go -- you didn't put that on the same axis as  
5   what we have on left here, is that right?

6   **A.**   Correct. You wouldn't see it, and I didn't need to  
7   because I did the index alternative.

8   **Q.**   If we could go to Slide 16. And, similarly, you have  
9   another chart here where you said that azoxystrobin sales  
10   followed US farm income, is that right?

11   **A.**   Yes, the changes followed, yes.

12   **Q.**   And, Mr. Jarosz, let's take a look at the axes that you  
13   chose. This is the chart that you prepared, is that right?

14   **A.**   Yes, it is.

15   **Q.**   And on the left-hand side, you go from 90 -- or 50 billion  
16   to 130 billion, is that right?

17   **A.**   Yes.

18   **Q.**   And on the right-hand side, you go from 170 million to  
19   230 million?

20   **A.**   Correct.

21   **Q.**   And the entire axis on the right-hand side, that's about a  
22   60 million range, is that right?

23   **A.**   Yes, that's right.

24   **Q.**   That's less than an tenth of an billion, isn't it?

25   **A.**   That's right.

1   **Q.**   So if you plotted what you have here in orange on the same  
2 axis that you have here on the left, that would be a pretty  
3 flat line, wouldn't you say?

4   **A.**   Correct, but if you index it like I did --

5   **Q.**   Mr. Jarosz, that was my question.

6                 **MR. NEUMAN:**   May the witness be allowed to explain  
7 his answer?

8                 **THE COURT:**   Well, it's a yes or no answer. You can  
9 ask him on redirect if you want.

10          **BY MR. SANTHANAM:**

11          **Q.**   So that's a yes, Mr. Jarosz?

12          **A.**   Still a yes, yes.

13          **Q.**   Now, I'd like to talk a little bit about Slide 10 -- 11,  
14 excuse me, if we can go back to that. This is a chart that you  
15 said that you were very excited about. Is that right?

16          **A.**   Yes, we economists get excited about things like this.

17          **Q.**   And I believe the opinion that you had was, if Syngenta,  
18 instead of picking -- going with Dr. Wilner, instead of using  
19 the 2014 budget as a benchmark -- an initial benchmark, and  
20 picked one of the later projections, his damages numbers would  
21 have been --

22                 **THE COURT:**   Would have what?

23          **BY MR. SANTHANAM:**

24          **Q.**   They would have been lower, is that right?

25          **A.**   Yes.

1   **Q.**   And Mr. Jarosz, one of the -- I guess, the observations  
2   you're pointing out here is that on the top line here, Slide  
3   11, you're plotting out the gross budgets. You see that?

4   **A.**   Gross profits budget, yes.

5   **Q.**   Gross profits budget. And at the bottom there, fourth  
6   line down, you have the actual gross profits, do you see that?

7   **A.**   Yes, I do.

8   **Q.**   And so, your observation is that if you go into 2014, in  
9   April, May, and June, those two numbers, the gross profits  
10   budget and the actual gross profits, they're getting closer and  
11   closer, is that right?

12   **A.**   Yes, that's right.

13   **Q.**   Doesn't that -- and doesn't that indicate, Mr. Jarosz,  
14   that Syngenta, once it learned of Willowood's activities in the  
15   marketplace, they're actually forecasting -- you know,  
16   forecasting what Willowood was going to do pretty well, isn't  
17   that right?

18   **A.**   Their forecasts were improving, but this seems to be  
19   tracking corn prices and farm income quite closely.

20   **Q.**   Well, Mr. Jarosz, their forecasts improved as you went  
21   through 2014, is that right?

22   **A.**   Yes, and one would expect that.

23   **Q.**   And surely, you, because you were here during trial, you  
24   would have heard the testimony of Mr. Andrew Fisher about how  
25   he got on a plane in early 2014 to go calm down distributors as

1 a result of market intelligence, is that right?

2 **A.** Yes.

3 **Q.** And, surely, you've heard testimony about how he was  
4 having to offer discounts to distributors because they were  
5 worried about Willowood in the marketplace in early 2014, is  
6 that right?

7 **A.** I don't recall the precise testimony in that regard.  
8 Perhaps you have something to refresh my recollection.

9 **Q.** Now, Mr. Jarosz, I'd like to -- if we go to slide -- well,  
10 let's talk -- if we can put that away for a second.

11 You mentioned this concept of elasticity, do you  
12 recall that?

13 **A.** Yes. I think I mentioned it once, maybe twice, but I did  
14 mention it.

15 **Q.** And you indicated that, well, farmers are going to be more  
16 sensitive to buying fungicides as opposed to herbicides, such  
17 as mesotrione. Do you recall that testimony?

18 **A.** Yes, generally.

19 **Q.** And do you recall hearing testimony from Syngenta  
20 witnesses, including Mr. Fisher, that there's something called  
21 plant performance that's unique to azoxystrobin?

22 **A.** Yes, I recall that.

23 **Q.** And, in particular, you understand that Mr. Fisher  
24 testified that plant performance is something that allows --  
25 that causes farmers to actually start budgeting fungicide,

1 specifically, azoxystrobin, isn't that right?

2 **A.** Yes. I think it reduces the price elasticity, but it's  
3 still very, very high. I saw that throughout the Syngenta  
4 documents.

5 **Q.** Well, Mr. Fisher testified that it does make it more  
6 inelastic, isn't that right?

7 **A.** More inelastic, but still very elastic.

8 **Q.** My question was, it makes it more inelastic, isn't that  
9 right?

10 **A.** Yes. As I said, yes, more inelastic, but still very  
11 elastic.

12 **Q.** Now, Mr. Jarosz, I want to talk a little bit about this  
13 concept of reasonable royalties that you've put forth. Now,  
14 with respect to the compound patents, you said that Syngenta  
15 shouldn't have any reasonable royalties because they -- you  
16 know, Willowood could have just moved their activities  
17 overseas, is that right?

18 **A.** Yes, or, more precisely, a nominal amount based on  
19 Ms. Kay's testimony.

20 **Q.** Now, Ms. Kay didn't actually provide any information about  
21 the specific availabilities of any formulators outside the  
22 United States, correct?

23 **A.** I think she talked about specific formulators outside the  
24 United States. My memory is, of course, not perfect.

25 **Q.** She didn't come out with a calendar saying, this

1 formulator would have had availability, would have dropped  
2 everything and taken on Willowood's work in 2013, is that  
3 right?

4 **A.** Correct, I don't recall seeing that.

5 **Q.** And she didn't provide any testimony along those lines  
6 about an analytical testing laboratory that would drop  
7 everything in 2013 and pick up Willowood's work, is that right?

8 **A.** I don't think she pointed to a particular analytical  
9 chemistry lab --

10 **Q.** She did not?

11 **A.** -- as I recall.

12 **Q.** She did not, is that right?

13                   **THE COURT:** Don't talk over him.

14 **BY MR. SANTHANAM:**

15 **Q.** Mr. Jarosz, you were here when Mr. Heinze testified that  
16 Syngenta was aware of the compound patents -- all of the  
17 patents in early 2013, isn't that right -- excuse me.  
18 Willowood was?

19 **A.** Willowood was aware of the compound patents. I think he  
20 also said the process patents, but I don't recall that as  
21 clearly.

22 **Q.** Now, Mr. Jarosz, you also -- were you here when Mr. Heinze  
23 testified that he understood that when the 5 kilograms were  
24 imported into the United States, he understood that that likely  
25 infringed the compound patents, correct?

1   **A.**   Yes. I think he said, we messed up. I think he  
2 acknowledged that.

3   **Q.**   Well, don't you think that if Mr. Heinze and Willowood  
4 knew that importing would infringe -- or likely infringe, and  
5 it was so easy to just move their operations overseas, that  
6 they would have done it?

7   **A.**   I'm sorry. In advance, I don't think he knew that he was  
8 messing up. He later found out that he messed up, and then, I  
9 think he had correspondence with his patent attorney, and the  
10 patent attorney said, it's already happened, you can't undo it.

11   **Q.**   Mr. Jarosz, that was not the path that Willowood took, is  
12 that right? They did not decide, knowing that the patents, the  
13 importation would likely infringe, they did not choose to move  
14 their operations overseas, correct?

15   **A.**   Correct. In advance, they did not know they were going to  
16 mess up. After the fact, they determined that they did.

17   **Q.**   Now, I'd like to talk a little bit about the process  
18 patents. You provided some reasonable royalty calculations  
19 with respect to the process patents, is that right?

20   **A.**   Yes, that is.

21   **Q.**   And you performed some analysis, and you came up with  
22 roughly about two -- a little over \$2 million for reasonable  
23 royalties on the '138 and '761 patents, is that right?

24   **A.**   That's right, if you add those together.

25   **Q.**   Now, Mr. Jarosz, that would assume that there's a

1 non-infringing alternative to those patents, is that right?

2 **A.** No, it doesn't specifically assume that, no.

3 **Q.** Well, you're not -- again, you're not a chemist, that's  
4 correct?

5 **A.** Correct, I am not.

6 **Q.** You're not a process chemist that would be able to  
7 determine how to run a chemical reaction at a large scale?

8 **A.** I absolutely am not; correct.

9 **Q.** You have no experience in running a manufacturing  
10 facility, is that right?

11 **A.** That's correct.

12 **Q.** And, let's talk a little bit about the hypothetical  
13 negotiation. In that hypothetical negotiation, you would agree  
14 that both parties, Syngenta and Willowood, would have to come  
15 to some sort of voluntary agreement, is that right?

16 **A.** We presume that, yes, that there would be some agreement  
17 between the parties.

18 **Q.** And is it your opinion that Syngenta would agree to a  
19 reasonable royalty of \$2 million -- around -- a little over  
20 \$2 million, knowing that someone would come in, taking their  
21 patented product, and devalue the market?

22 **A.** I don't know what they would agree to or what Willowood  
23 would agree to. I'm pretty sure Syngenta would want hundreds  
24 of millions of dollars and Willowood would want zero. I'm  
25 trying to determine what should be paid in light of the

1 economics and in light of Syngenta's perspectives as of a  
2 hypothetical negotiation.

3 **Q.** Now, Mr. Jarosz, you provided two reports in this case, is  
4 that right?

5 **A.** Yes, an original report and a supplemental report.

6 **Q.** The first one was on September 12th of last year?

7 **A.** That sounds right. I recall it was September.

8 **Q.** And the other one was on October 6th of last year?

9 **A.** That sounds right. I remember it was October.

10 **Q.** And that you testified at a deposition as well just the  
11 day after your second report, is that right?

12 **A.** Yes. You deposed me for a very long day.

13 **Q.** Well, I apologize about that, but I do want to bring back  
14 those memories for just a minute.

15 **A.** Thank you.

16 **Q.** So, those reports -- you know, you indicated you've been  
17 involved as an expert in a number of cases --

18 **A.** Yes.

19 **Q.** -- is that right?

20 **A.** I'm sorry. I thought you were done. Yes, I have.

21 **Q.** And you understand that the purpose of a report is to set  
22 forth your opinions and bases for your opinions, is that right?

23 **A.** Yes.

24 **Q.** And you understand that you're supposed to set forth all  
25 of your opinions and bases, is that right?

1   **A.**   Yes.

2   **Q.**   And you were deposed shortly after you submitted these  
3 reports with respect to the opinions in your report, is that  
4 right?

5   **A.**   Yes.

6   **Q.**   And although, today, you know, you -- today you had -- you  
7 spoke when Mr. Neuman was questioning you about various things  
8 you remember throughout trial from Ms. Kay, and Mr. Heinze, Dr.  
9 Wilner, Mr. Cecil, and Mr. Fisher. Do you recall all of that?

10   **A.**   Yes.

11   **Q.**   At your deposition, however, you had a lot of -- when I  
12 was asking questions, you had a lot of difficulty answering or  
13 remembering things, isn't that right, Mr. Jarosz?

14   **A.**   No, I remembered what I could.

15   **Q.**   Well, let me see if I can refresh your recollection.

16   Mr. Jarosz, when I asked you at your deposition, Had you ever  
17 heard of azoxystrobin before this case, you testified, I don't  
18 recall. Is that right?

19   **A.**   Yes. That's still the case.

20   **Q.**   And when I asked you, you know, whether you had performed  
21 an analysis of sales of azoxystrobin sales before this case,  
22 you answered, Not that I recall. Is that right?

23   **A.**   Correct. I still agree with that.

24   **Q.**   And when I asked you, Mr. Jarosz, whether you had spoken  
25 to anyone at Adjuvants, the entity that actually developed the

1 formulations for Willowood's products, you answered, Not that I  
2 recall. Is that right?

3 **A.** Correct. I thought I was under oath then, as I am now.

4 **Q.** And when I asked you, What type of formulation activities  
5 that Adjuvants carried out in 2013 on behalf of Willowood, you  
6 answered, I don't know the specifics. Isn't that right?

7 **A.** I said those words. I'm not sure if I used the face that  
8 you just did.

9 **Q.** And when I asked you, Mr. Jarosz, whether  
10 Willowood -- whether you asked Willowood whether they are aware  
11 of any formulators outside the United States that were capable  
12 of carrying out the formulation activities that Adjuvants  
13 performed for Willowood in 2013, you answered, Not that I  
14 recall. Is that right?

15 **A.** Yes, that's right.

16 **Q.** And when I asked you if -- Are you familiar with an entity  
17 called Yancheng Tai He Chemicals Company, you answered, I've  
18 seen that name, and I don't have a perfect recollection of it.  
19 Is that right?

20 **A.** Correct.

21 **Q.** When I asked you, What's your best understanding of what  
22 Yancheng Tai He Chemical Company does, you answered, I just  
23 don't recall sitting here right now, I'm sorry. Is that right?

24 **A.** That's probably what I said. I don't recall what I said  
25 then, but I -- my memory has been refreshed by that.

1     **Q.** When I asked you, Did you investigate how much Willowood's  
2 manufacturer actually incurs in manufacturing azoxystrobin --

3                 **THE COURT:** Actually what? I couldn't hear the word.

4     **BY MR. SANTHANAM:**

5     **Q.** When I asked you, Did you investigate how much Willowood's  
6 manufacturer actually incurs in manufacturing azoxystrobin  
7 technical, you answered, I don't recall if I have those  
8 records. That was your testimony?

9     **A.** Correct.

10    **Q.** And when I asked you, Did you inquire whether  
11 Willowood -- Did you inquire whether Willowood's established  
12 existing relationships allowed it to expedite its EPA  
13 registration process, you answered, Not that I recall. Is that  
14 right?

15    **A.** That sounds right, yes.

16    **Q.** And when I asked you, Did you ask Ms. Kay as to whether  
17 Willowood's established relationships with testing labs and  
18 formulators allowed Willowood to accelerate its registration  
19 with the EPA, you answered, I don't know. Is that right?

20    **A.** Yes.

21    **Q.** When I asked you, Do you know what particular tests that  
22 Analytical & Regulatory Chemistry, the agency that performed  
23 testing in advance of Willowood's registration process, carried  
24 out, you answered, I may have seen that, but I don't remember  
25 seeing it. Is that right?

1   **A.**   That sounds right, yes.

2   **Q.**   And when I asked you, Did you ask Ms. Kay about what  
3 Analytical & Regulatory Chemistry did, you answered, I don't  
4 know that we did. Is that right?

5   **A.**   That sounds right, yes.

6   **Q.**   And when I asked you, Are you aware that Mr. Brian Heinze,  
7 Willowood USA CEO, has testified that Willowood was aware of  
8 the four Syngenta patents by early to mid-2013, you answered, I  
9 don't recall what his testimony was. Is that right?

10   **A.**   Yes, I didn't recall what his testimony was, yes.

11   **Q.**   And when I asked you, Are you aware of any instances in  
12 which Cheminova has sold products for crop protection use on  
13 corn, you answered, Instances? I don't recall if I saw sales.  
14 Is that right?

15   **A.**   Correct. I think that's correct.

16   **Q.**   And when I asked you, Are you aware of any instances in  
17 which Albaugh had sold crop protection products for corn, you  
18 answered, I don't recall seeing Albaugh sales, so I don't know.  
19 Is that right?

20   **A.**   That's correct.

21   **Q.**   Mr. Jarosz, you understand how to testify at a deposition,  
22 is that right?

23   **A.**   I think so, yes.

24   **Q.**   In fact, Mr. Jarosz, you've testified, at least as of last  
25 October, in about 200 to 250 depositions, is that right?

1   **A.**   Yes, that sounds right.

2   **Q.**   And of those 200 to 250 depositions -- well, actually, as  
3 of last October when I asked, you were charging about \$700 an  
4 hour for every hour you billed, is that right?

5   **A.**   My firm was charging my time at \$700 an hour, yes.

6   **Q.**   And when Mr. Neuman asked earlier today, you indicated  
7 that you are a managing principal at your firm, is that right?

8   **A.**   Yes.

9   **Q.**   So for every one of those \$700-per-hour that you charge,  
10 you share in the profits of your firm, is that right?

11                   **MR. NEUMAN:** Objection.

12                   **THE COURT:** Overruled. You can answer.

13                   **THE WITNESS:** My compensation is not directly tied to  
14 case billings. I do share in the profits of the firm because I  
15 helped build the firm.

16                   **BY MR. SANTHANAM:**

17   **Q.**   Mr. Jarosz, my question was slightly different. For every  
18 dollar you bill, your firm earns more money, is that right?

19   **A.**   Yes. I didn't know that was your previous question, but I  
20 agree with you.

21   **Q.**   And you share in the profits of your firm, is that right?

22   **A.**   I do share in the profits of my firm, yes.

23   **Q.**   Now, Mr. Jarosz, as of October 7th, 2016, when your  
24 deposition took place, your firm had billed somewhere between  
25 150 to 200,000 dollars in this matter, is that right?

1 | **A.** That sounds right, yes.

2 Q. And you've been working -- presumably, your firm has been  
3 billing more in the year since then, is that right?

4 A. Yes. Not continuously, but at various points in time,  
5 yes.

6 MR. SANTHANAM: No further questions, Your Honor.

7 THE COURT: Redirect?

8 MR. NEUMAN: A few questions, Your Honor.

## REDIRECT EXAMINATION

10 | BY MR. NEUMAN:

11 Q. Mr. Jarosz, have you heard any testimony or seen any  
12 evidence in this case that Albaugh and Cheminova/FMC are not  
13 infringing any of the process patents at issue in case?

14                   **THE COURT:** I'm sorry. You're looking down, and I  
15 couldn't hear.

16 MR. NEUMAN: I'm sorry.

17 | BY MR. NEUMAN:

18 Q. Have you seen any evidence or heard any testimony in this  
19 case that Albaugh and Cheminova/FMC are infringing the patents  
20 at issue in this case?

21 A. No. I've seen none -- or I've heard none.

22 Q. Mr. Santhanam asked you a few questions about Albaugh.

23 Bonnie, could you please pull up Plaintiff's 265 in evidence.  
24 Could you pull up towards the bottom where it says -- that's  
25 fine. Bottom of first page. Pull that up, please.

1                   Do you see the e-mail from Scott Langham to Jeff  
2 Cecil at Syngenta dated November 18th, 2015? Do you see that?

3 **A.** Yes, I do.

4 **Q.** And do you see that Albaugh quoted CPS a price for  
5 azoxystrobin? Do you see that?

6 **A.** Yes, I do.

7 **Q.** And that was not for seed care, was it; that was to CPS?

8 **A.** Yes. CPS is Crop Protection Services.

9 **Q.** Bonnie, could you please pull up Jarosz 16 -- Jarosz  
10 Slide, Demonstrative 16.

11                 Now you were asked a few questions about this slide  
12 by Mr. Santhanam. Do those two lines show the relative  
13 increase or decrease in the two -- in farm income and  
14 azoxystrobin sales at the same time?

15 **A.** Absolutely, they do, and I indexed those to 100 to see if  
16 the shapes were the same, and they were the same.

17 **Q.** So the point of the slide was to show the relative  
18 movements, is that right?

19 **A.** Yes, what is going up and down at the same time.

20 **Q.** Do you recall Dr. Wilner's testimony that, in fact,  
21 Syngenta did not drop its prices for azoxystrobin in 2014 other  
22 than 3 cents or so? Do you recall that?

23 **A.** Yes, I do.

24 **Q.** And do you recall testimony and evidence in this case  
25 that, in fact, Syngenta raised its price for azoxystrobin in

1 November 2014?

2 **A.** Yes, I recall hearing that.

3 **Q.** Mr. Santhanam asked you a few questions about Janelle  
4 Kay's testimony in this case, and I want to clarify. Did you  
5 hear her identify two laboratories overseas that can conduct  
6 the PhysChem testing of the type that was done for Willowood in  
7 the United States?

8 **MR. SANTHANAM:** Objection, leading.

9 **THE COURT:** Overruled. You can answer.

10 **THE WITNESS:** Yes, I did.

11 **BY MR. NEUMAN:**

12 **Q.** Now, in the report that you issued last year before your  
13 deposition, did you note in that report conversations with  
14 Ms. Kay -- in the written report -- conversations with Ms. Kay  
15 by you or people working under your supervision to support your  
16 analysis?

17 **A.** Yes. I'm sorry. I thought you were done. Yes, I do.

18 **Q.** I want to talk to you about crop enhancement and  
19 elasticity for a moment. Did Mr. Fisher or Mr. Cecil or  
20 Dr. Wichert make any effort to quantify the extent to which the  
21 asserted crop enhancement features of azoxystrobin would change  
22 the price elasticity that otherwise would apply to  
23 azoxystrobin?

24 **A.** No, I didn't hear any or see any, but I saw many Syngenta  
25 documents that had very high elasticities for the product.

1     **Q.**   Did Dr. Wilner make any effort to quantify the extent to  
2 which the purported crop enhancement features of azoxystrobin  
3 would change the price elasticity of its azoxystrobin products?

4     **A.**   Not that I heard or saw.

5                 **MR. NEUMAN:**   No further questions.

6                 **THE COURT:**   Anything else?

7                 **MR. SANTHANAM:**   No recross, Your Honor.

8                 **THE COURT:**   No?   All right.   Thank you.   You may step  
9 down.

10                 (At 12:03 p.m., witness excused.)

11                 **MR. TILLER:**   Your Honor, that's our last live  
12 witness.   We have a couple administrative issues that we need  
13 to deal with, I think, outside --

14                 **THE COURT:**   Okay.   Are you talking about exhibits?

15                 **MR. TILLER:**   Some proffers, just to -- for clarity of  
16 the record.

17                 **THE COURT:**   All right.   Well, ladies and gentlemen,  
18 let me excuse you to the jury room for just a moment.   Don't  
19 talk about the case.

20                 (At 12:03 p.m., jury excused.)

21                 **THE COURT:**   Okay.

22                 **MR. TILLER:**   Your Honor, Felix Chen, who is one of  
23 witnesses that you excluded, we just wanted to proffer for the  
24 record generally what Mr. Chen would testify to.   Mr. Chen has  
25 worked with --

1                   **THE COURT:** I'm sorry. I can't hear, and I'm not  
2 sure what -- where is he?

3                   **MR. TILLER:** Oh, he's not -- you've excluded him.

4                   **THE COURT:** Yes, I know. So what's your -- what are  
5 you doing?

6                   **MR. TILLER:** I was going to put into the record a  
7 proffer of, generally speaking, what he would testify to if he  
8 were here.

9                   **THE COURT:** Um, okay.

10                  **MR. TILLER:** Mr. Chen has worked with --

11                  **THE COURT:** As long as it doesn't take very long  
12 because the jury's waiting.

13                  **MR. TILLER:** I have two, very quick.

14                  Mr. Felix Chen has worked with Guanda for seven  
15 years. He is the material control manager there. As the  
16 material control manager, he manages Guanda's warehouse. In  
17 reviewing the documents produced by Tai He, which were offered  
18 as DX-169, he confirmed that 101 is the code for azoxystrobin  
19 and that both Guanda and Tai He use that code. Guanda has  
20 three to five customers who purchase azoxystrobin from it.  
21 Guanda and Tai He are business partners. The code 101-B is the  
22 code for high hydroxybenzonitrile, which is one of reactants to  
23 making azoxystrobin. 101-C is the code for the etherate, which  
24 is also a reactant to make azoxystrobin. Guanda obtains the  
25 etherate that it uses to make azoxystrobin from Guosheng. He

1 does not know what DABCO is. He has never seen DABCO in the  
2 Guanda warehouse. And all reactant solvents and other  
3 materials used in the production of azoxystrobin at Guanda are  
4 stored in that warehouse.

5                 Second, Mr. Chiu Zhenghong is a vice president at Tai  
6 He. His sole responsibility is Tai He formulation. He  
7 prepared the information for Guanda to manufacture the  
8 azoxystrobin, and he would confirm that Guanda performs only  
9 the condensation step. He says that the only intermediates  
10 used by Guanda to manufacture azoxystrobin are etherate, which  
11 is purchased from Guosheng, and hydroxybenzonitrile purchased  
12 from Yongkai. He has heard of DABCO, but he does not know what  
13 it is used for. He would confirm that Tai He does not use  
14 DABCO in the manufacture of azoxystrobin.

15                 So those are just the proffers, Your Honor, and I  
16 think we would be resting, and we would just renew the motions  
17 that we made at the close of Plaintiff's case.

18                 **THE COURT:** All right. Do you have motions at this  
19 point?

20                 **MR. LEVINE:** Yes, Your Honor. We move -- Syngenta  
21 moves under Rule 50(a) for judgment as a matter of law with  
22 respect to infringement of the DABCO patent; in particular,  
23 that Willowood has not overcome the presumption of  
24 infringement. The evidence has not rebutted that presumption,  
25 and, therefore, judgment as a matter of law under Rule 50(a).

Secondly, we move for judgment as a matter of law under Rule 50(a) with respect to the validity issue pertaining to the DABCO patent. Willowood's evidence has not shown by clear and convincing evidence that the DABCO patent is invalid.

5                   **THE COURT:** And for -- your motion, Mr. Tiller,  
6 specifically?

7           **MR. TILLER:** Again, as to the '761 patent or the  
8 DABCO patent that, there is no evidence that -- of  
9 infringement.

10 And two, as to damages, again, renewing the motion as  
11 to Dr. Wilner's opinion evidence.

12                   **THE COURT:** All right. This is what I propose. Just  
13 a second. This is -- what I propose is I'll bring the jury in  
14 and. I'm going to let them go to lunch. I'll hear from you a  
15 little bit. Then when -- then we'll come back, and if Syngenta  
16 has rebuttal evidence, which you expect at this point?

17                   **MR. LEVINE:** Yes, and I did just want to note for the  
18 record, for procedural purposes, we renew our earlier  
19 Rule 50(a) motion to the extent -- well, and we'll do that  
20 after our rebuttal case again just out of an abundance of  
21 caution.

22                   **THE COURT:** All right. Let me bring the jury in and  
23 sends them to lunch.

24 || (At 12:09 p.m., jury present.)

**THE COURT:** Don't get too comfortable. I'm going to

1 let you all go on to lunch. I have some housekeeping matters  
2 to take up with the lawyers. When you all come back from  
3 lunch, we'll finish up the evidence this afternoon. So why  
4 don't you all come back at 1:25. All right? So that will give  
5 you an hour and 15 minutes. Don't get wet, don't talk about  
6 the case, and don't form any opinions, and please be back at  
7 1:25.

8 (At 12:10 p.m., jury excused.)

9 **THE COURT:** Okay. I'd like to hear from Syngenta on  
10 the validity issue about the DABCO patent.

11 **MR. LEVINE:** Your Honor, on that issue, the only  
12 evidence that we heard was Dr. Lipton's opinion that the Patent  
13 Office got it wrong. In his opinion, the Patent Office got it  
14 wrong. Under 35 U.S.C. 282, patents are presumed valid. It's  
15 a clear and convincing evidence standard in order for them to  
16 overcome that presumption of validity, and the only evidence  
17 that was presented was Dr. Lipton's "I think the Patent Office  
18 got it wrong."

19 In addition, what he said was the underlying basis  
20 for that opinion of the Patent Office getting it wrong was that  
21 out of billions and billions, trillions of possibilities of  
22 molecules that Weintritt talked about, he happened to pick out  
23 of thin air the one molecule that was azoxystrobin. That is  
24 simply insufficient evidence to overcome the presumption of  
25 validity based on him simply saying "I think the Patent Office

1 got it wrong."

2                   Weintritt was considered by the Patent Office. They  
3 considered those very arguments, and they ultimately concluded  
4 that Weintritt taught away from what Dr. Whitton was teaching  
5 in terms of using the condensation step and -- or excuse me --  
6 using DABCO in the condensation step for purposes of making  
7 azoxystrobin and using it in less concentrations than what was  
8 disclosed in Weintritt. In other words, the very arguments  
9 that Dr. Lipton was making were already considered and rejected  
10 by the United States Patent Office, and there is no evidence  
11 other than I think -- you know, as he said, "I think the Patent  
12 Office got it wrong."

13                  The Patent Office got it right, and that's why, under  
14 Rule 50(a), judgment as a matter of law should be granted to  
15 Syngenta on that issue.

16                  **THE COURT:** So are you saying his opinion is too  
17 conclusory? Is that what you're saying?

18                  **MR. LEVINE:** Well, it's partly that it's conclusory,  
19 but it's also partly that with a clear and convincing evidence  
20 standard that the tiny bit of bases that he provided to that  
21 conclusory opinion, namely, that azoxy is one of a trillion  
22 molecules that are, you know, within the scope of Weintritt,  
23 that doesn't overcome the clear and convincing evidence  
24 standard. It just doesn't get to that level.

25                  **THE COURT:** To that level. All right. Thank you.

1 The Defendant?

2           **MR. TILLER:** Your Honor, Mr. Levine talks about but a  
3 small, small portion of Dr. Lipton's testimony. What  
4 Dr. Lipton said was, the '138 patent claims and -- discloses  
5 and claims the exact same condensation reaction as is disclosed  
6 and claimed in the '761 patent. It, too, discloses use of a  
7 catalyst, although a different catalyst.

8           Then -- so you start with the condensation reaction  
9 in the '138 patent, which gives rise to -- which gives rise to  
10 azoxystrobin. So '138, which is clearly prior art, discloses  
11 the synthesis of azoxystrobin using the exact same condensation  
12 reaction as is claimed in the '761 patent; and, in fact, '138  
13 calls for a catalyst.

14           It is then that there is in -- I don't believe there  
15 will be any dispute that Weinritt does, in fact, disclose the  
16 synthesis of azoxystrobin. Yes, among many, many compounds,  
17 but, again, you start with '138. You then look at Weinritt,  
18 and a person of ordinary skill in the art is deemed to know  
19 about the prior art, the prior analogous art. They're deemed  
20 to know all of it. And when that person of ordinary skill in  
21 the art has -- starts with the '138 patent and everything  
22 that's disclosed in there, and then has the Weinritt  
23 disclosure, which shows that down to as little as two molar  
24 percent of DABCO can catalyze that reaction, it leaves for the  
25 person of ordinary skill in the art the sole difference between

1 what's in '138, in combination with Weintritt, versus '761.  
2 The sole difference is that '138, in view of Weintritt, calls  
3 for the use of a condensation reaction to synthesize  
4 azoxystrobin using as little as 2.0 molar percent DABCO.

5           What is claimed, as you know, is up to or between .1  
6 molar percent and two molar percent. So literally the two  
7 join, the two literally meet up together. There is literally  
8 no space in between the two. That -- the person of ordinary  
9 skill in the art, and Dr. Lipton testified, the person of  
10 ordinary skill in the art is always looking to try to lower the  
11 amount of catalyst for all the reasons he testified to, and a  
12 person of ordinary skill in the art, he said, would have tried  
13 lower amounts than two molar percent, and would have reasonably  
14 expected for that to work.

15           Indeed, we saw, in one of Syngenta's own lab  
16 notebooks, that somebody realized, wow, 5 percent is covered,  
17 we need to try 1 percent. That's exactly what the person of --  
18 that's exactly what Dr. Lipton testified to would be the  
19 thought process of the person of ordinary skill in the art.

20           And Mr. Levine is simply incorrect when he says that  
21 the examiner found that Weintritt actually teaches away from  
22 using two molar percent or below. Now, that was an argument  
23 that was made by the applicants, among another -- among other  
24 arguments, but that was not the ultimate finding, because we  
25 don't know what the ultimate finding was.

1                   **THE COURT:** I didn't remember any evidence about that  
2 one way or the other. It may be --

3                   **MR. TILLER:** There wasn't --

4                   **THE COURT:** It may be in the documents. I don't  
5 know.

6                   **MR. TILLER:** -- that's my point.

7                   And remember, Weintritt used the terminology in  
8 general when referring to 2 percent to 40 percent. And as  
9 Dr. Lipton testified to, that would lead a person of ordinary  
10 skill in the art to think that while 2 percent of 40 percent is  
11 being claimed, something potentially outside of 2 percent to  
12 40 percent could work.

13                  **THE COURT:** Okay. Now you're repeating yourself.

14                  **MR. TILLER:** All of that leads to the conclusion that  
15 there is at least more than enough evidence for the jury to  
16 conclude, even by a clear and convincing evidence standard,  
17 that the patent is invalid.

18                  **THE COURT:** Any rebuttal on that?

19                  **MR. LEVINE:** Yes, Your Honor. As you noted it was a  
20 conclusory statement by Dr. Lipton that the patent office got  
21 it wrong, Weintritt allegedly renders the '761 obvious. It was  
22 a classic example of a hindsight analysis. He looked at the  
23 '761 and then worked backwards and said the '761 relates to  
24 azoxy, so then he tried to look in Weintritt and find azoxy and  
25 out of trillions and trillions of possibilities, hindsight

1 allowed him to pick that one molecule.

2           **THE COURT:** Well, didn't he say he started with the  
3 '138, and that is not hindsight, because that is out there in  
4 the world.

5           **MR. LEVINE:** Right.

6           **THE COURT:** And it's about azoxystrobin.

7           **MR. LEVINE:** Yes. The '138 is about azoxy. The  
8 condensation step in azoxy, it is a little different than the  
9 condensation step in the '761. They both have condensation,  
10 but it's not exactly the same. But my point is that the  
11 hindsight analysis is he knew what the end result was that he  
12 was looking for, and that's what he then approached Weintritt.  
13 He looked at Weintritt, with the knowledge of the '138, and  
14 used the hindsight analysis but, ultimately, at the end of the  
15 day, all it is is a conclusion by him that the patent office  
16 got it wrong.

17           And the arguments were presented to the Patent and  
18 Trademark Office in the response by the applicant, Dr. Whitton,  
19 as Mr. Tiller said. Those arguments were made. We do know  
20 what the patent office did in terms of not only allowing the  
21 argument, but allowing those arguments because of the response  
22 that Dr. Whitton made to the patent office.

23           And, David, if you could please pull up DX-5. This  
24 is the issue notification. The notice of allowability is what  
25 I'm looking for. Keep going. Yeah, one back. Okay. And,

1 yes, in Blowup No. 1.

2                   And what it says, Your Honor, is this communication,  
3 the notice of allowability is responsive to applicant's remarks  
4 filed on August 17, 2011. So what the examiner is saying is I  
5 considered the arguments that you, Dr. Whitton, made in  
6 response to the rejection that had been previously made by the  
7 examiner about Weintritt and allowed the application.

8                   So those arguments were considered and accepted by  
9 the patent office. The patent issued under 35 USC 282. It is  
10 presumed valid. The evidentiary standard that Willowood has to  
11 overcome is clear and convincing evidence, and the conclusory  
12 statements and opinions by Dr. Lipton do not overcome that  
13 standard. Thank you.

14                 **THE COURT:** All right. Well, it seems -- I'm going  
15 to keep that under advisement pending the rest of the evidence.  
16 You should assume it'll be denied, and we'll proceed with  
17 rebuttal evidence in a little bit over an hour.

18                 What are you all going to have?

19                 **MR. LEVINE:** Your Honor, we will have Dr. Joe  
20 Fortunak. We also will have Dr. Alan Whitton. We may have a  
21 short video clip deposition of Mr. Wu, and we are evaluating  
22 any additional evidence that we'll bring, but we're cognizant  
23 of the time.

24                 **THE COURT:** All right. Well, I do want to get all of  
25 the evidence in today. I don't want to be back tomorrow. I

1 don't know exactly where we are, but we'll stay today until we  
2 get the evidence in. So I'll check about the time limits here.  
3 I think we had a bunch of time out of the presence of the jury  
4 on evidentiary objections.

5           **MR. LEVINE:** Your Honor, if I may, just for the  
6 record, as you said you'll be considering this issue with  
7 respect to validity of DABCO. The i4i versus Microsoft case is  
8 the one that states that prior art that was previously  
9 considered should be given less weight, and that's actually a  
10 statement that's in the proposed jury instructions.

11           **THE COURT:** I recognized it, but I'm glad to have the  
12 cite because I did not identify where that came from, so I'll  
13 take a look at that case.

14           **MR. TILLER:** Do you want me to respond to that, or --  
15 I don't need to if you don't --

16           **THE COURT:** Unless you have a case you want me to  
17 look at over the lunch break, I'm good.

18           **MR. TILLER:** No, but I would just note that I think  
19 we have filed -- submitted cases in the past. The standard is  
20 always clear and convincing. You don't -- there's not a lesser  
21 standard or a higher standard if the evidence --

22           **THE COURT:** That's right.

23           **MR. TILLER:** It's always the same standard.

24           **THE COURT:** Yeah, I didn't hear anything about a  
25 different standard so -- but, yeah, okay. Anything else?

1 Anything likely -- I don't really particularly remember  
2 anything about the Dr. Fortunak coming up earlier.

3           **MR. LEVINE:** No, Your Honor, and that's because with  
4 the burden shifted on the DABCO patent, he's now coming in to  
5 rebut the evidence that was presented.

6           **THE COURT:** Okay. I'll see you all in about an hour.  
7 We'll be in recess until 1:25.

8                         (At 12:24 p.m., break taken.)

9           **THE COURT:** My clerk tells me Syngenta is at 13 hours  
10 and 13 minutes, and Willowood is at 13 hours and 45 minutes.  
11 Okay. Anything before we bring the jury in? No?

12           **MR. LEVINE:** Since you're doing the math, the witness  
13 we're going to call now is the video clip of Mr. Wu.

14           **THE COURT:** Okay.

15           **MR. LEVINE:** Twenty-three minutes total; 20 minutes  
16 of that will be allocated to Syngenta, three minutes will be  
17 allocated to Willowood for the counter-designations.

18           **THE COURT:** All right. You can bring the jury in.

19                         (At 1:26 p.m., jury present.)

20           **THE COURT:** All right. Good afternoon. I hope  
21 nobody got drenched. There was quite a downpour during the  
22 lunch hour. I believe we are ready to continue. When you  
23 all -- after you all left for lunch, Willowood told me they had  
24 presented their evidence, so it is now Syngenta's opportunity  
25 for rebuttal evidence. So you can call your next witness.

1                   **MR. SANTHANAM:** Yes, Your Honor. We're going to call  
2 through deposition designation Wu Xiaolong.

3                   **THE COURT:** Okay.

4                   **MR. NEUMAN:** And, for the record, there are going to  
5 be exhibits used as part of this deposition designation and  
6 we've got courtesy binders prepared.

7                   **THE COURT:** All right. Ladies and gentlemen, this is  
8 the same Mr. Wu. You heard some of this testimony earlier. It  
9 was read to you without the video during Willowood's case, so  
10 Syngenta has some additional testimony they want you to  
11 consider, and you'll see the video deposition, but it's the  
12 same deposition of the same person, so you'll consider it as if  
13 the witness was present in court. I think there was an  
14 interpreter used, is that right?

15                  **MR. SANTHANAM:** That is correct.

16                  **THE COURT:** Yeah, so you'll notice that, and  
17 everybody was sworn just like normal. Yes?

18                  **MR. SANTHANAM:** Your Honor, there are three -- there  
19 are going to be three exhibits that are referenced in this  
20 deposition designation; two of which are already in evidence,  
21 Defendant's Exhibit 17, Defendant's Exhibit 116. 17 correlates  
22 to what is described as Plaintiff's Deposition Exhibit 63.  
23 It's also described as Deposition Exhibit 3.

24                  **THE COURT:** Just to be confusing it has two numbers?

25                  **MR. SANTHANAM:** It is confusing, but I want to make

1 | that a little bit clearer on the record.

2 THE COURT: All right.

3                   **MR. NEUMAN:** Defendant's Trial Exhibit 16 is referred  
4 to as Exhibit 1, and the other exhibit in there is Plaintiff's  
5 Trial Exhibit 194, which is referred to as Exhibit 4.

6 THE COURT: Four?

7                   **MR. SANTHANAM:** Exhibit 4, that's right, and we move  
8 for the admission of Plaintiff's Trial Exhibit 194.

**MR. TILLER:** We would object, Your Honor, relevance.

10                   **THE COURT:** All right. Overruled. It'll be  
11 admitted. You may proceed.

12 MR. SANTHANAM: Go ahead and play it.

13 (Video deposition excerpt of Wu Xiaolong played.)

14 THE COURT: Okay. You can call your next witness.

15 MS. BALTZER: Your Honor, we call Dr. Alan Whitton to  
16 the stand.

17                   **THE COURT:** Come on up. You are still under oath  
18 from your testimony last week.

19 MS. BALTZER: I have witness binders prepared again.  
20 May I approach?

THE COURT: You may.

22 DR. ALAN WHITTON,

23 || PLAINTIFF'S WITNESS, SWORN

## 1 DIRECT EXAMINATION

2 BY MS. BALTZER:

3 Q. Good afternoon, Dr. Whitton.

4 A. Good afternoon.

5 Q. So, Dr. Whitton, after manufacturing azoxystrobin at  
6 Syngenta, do molecules other than azoxystrobin end up being in  
7 the final technical product of azoxystrobin?8 A. Yes. There are always some low levels of impurities in  
9 the product.10 Q. And when the technical product is formulated into an  
11 end-use product, do these impurities that you refer to remain  
12 in the azoxystrobin end-use product as well?

13 A. Yes. They all go through into the end-use product.

14 Q. And why is it that these impurities remain?

15 A. When you make any chemical reaction, you never get a  
16 hundred percent yield. You don't get a hundred molecules going  
17 in and hundred molecules of product you want going out, so you  
18 get byproducts and side reactions that give impurities. These  
19 have to come out at the end, but you don't get all of them out  
20 100 percent, so you always end up with some impurities in the  
21 product.22 Q. Are there any DABCO-related impurities that will remain in  
23 azoxystrobin?24 A. Yes. In azoxystrobin that Syngenta makes, we see three  
25 DABCO-related impurities.

1   **Q.**   And what are each of those?

2   **A.**   One of them is DABCO itself and we also see two  
3   DABCO-related impurities that can only come from the  
4   condensation step.

5                 **THE COURT:** I'm sorry. Could you just slow down just  
6   a hair? I was not quite following the second and third thing  
7   you said.

8                 **THE WITNESS:** My apologies, Your Honor.

9                 We see DABCO in the formulator products and in the  
10   technical, and we also see two DABCO-related impurities that  
11   can only come from the addition of DABCO into the condensation  
12   stage of the manufacture of azoxystrobin.

13   **BY MS. BALTZER:**

14   **Q.**   Dr. Whitton, if you could move the mic, I guess, maybe a  
15   little closer, that would be a little helpful for the jury.

16   **A.**   Oh. Sorry.

17   **Q.**   So these DABCO-related impurities that you are referring  
18   to, how do you look for those in a sample of azoxystrobin?

19   **A.**   We use a technique called LC-MS/MS.

20   **Q.**   What is that?

21   **A.**   It's a sophisticated analytical technique that is  
22   basically three machines joined together into one instrument.  
23   First of all, you have an LC, which is a liquid chromatography  
24   machine. What that does is it takes a complex mixture and it  
25   splits it into all its component parts.

1   **Q.**   What happens after that?

2   **A.**   The next bit is you have an MS instrument.

3   **Q.**   What does that stand for?

4   **A.**   Mass spectrometer. And that takes the peaks that are

5 coming off the HPLC, and you can break those down and see -- or

6 activate them and see what the molecular ions are, what the

7 molecules are that are in them, and you can see -- by a very

8 precise mass, you can count the atoms of carbon, hydrogen,

9 nitrogen, oxygen; and you can be very certain of the molecular

10 formula from that step.

11   **Q.**   So from using this LC-MS/MS --

12   **A.**   Sorry. There is a third step as well.

13   **Q.**   Oh. Sure. Go ahead.

14   **A.**   The third machine is another mass spec element. So you

15 can take a very specific peak from the first LC -- I'm sorry,

16 the first MS one and break that down into its component parts,

17 so get a fingerprint of that particular molecule.

18   **Q.**   So from using this LC-MS/MS technique, how can you tell if

19 there are particular impurities that are present?

20   **A.**   You see a very specific peak and you can see the mass of

21 the peak at very high resolution. It is very precise.

22   **Q.**   How does -- the mass of the peak that you are seeing, how

23 does that tell you what the impurity is you are looking at?

24   **A.**   Well, if you have a sample of the impurity that you know

25 what the structure is, you can compare the mass spec or the

1 LC-MS/MS peak that you see from a sample with an authentic  
2 sample and confirm the presence of those impurities.

3 **Q.** And is -- this peak that you are referring to, is it on a  
4 chart?

5 **A.** It is on a chart that comes straight out of a machine,  
6 yes.

7 **Q.** Have you used this LC-MS/MS technique to analyze whether  
8 DABCO and these DABCO-related impurities you were referring to  
9 are present in Willowood's azoxystrobin?

10 **A.** Yes, we have.

11 **Q.** How did you obtain a sample of Willowood's azoxystrobin?

12 **A.** Yes, we purchased it from a bottle in the United States.

13           **MS. BALTZER:** I'm showing the witness what has been  
14 marked as Plaintiff's Demonstrative Exhibit No. 28.

15 **BY MS. BALTZER:**

16 **Q.** Dr. Whittington, is this an example of the azoxystrobin that  
17 Syngenta tested from Willowood?

18 **A.** Yes, it is. That's the bottle that was tested from which  
19 the sample was taken and was tested.

20           **THE COURT:** So that was the Azoxy 2SC?

21           **THE WITNESS:** That was Azoxy 2SC of Willowood that  
22 was purchased in the United States.

23 **BY MS. BALTZER:**

24 **Q.** For the testing that Syngenta did on Willowood's Azoxy 2SC  
25 sample that it tested, did you oversee that testing?

1   **A.** Yes, I did. I initiated it and followed it closely.

2   **Q.** What did you do?

3   **A.** We knew the molecules that we were looking for, so I  
4 requested my analysts to run the Willowood sample and look for  
5 the three impurities that we were seeking.

6   **Q.** And was that with the LC-MS/MS technique you were  
7 referring to earlier?

8   **A.** That was on the LC-MS/MS.

9   **Q.** What did those results show?

10   **A.** What we found was we found all three peaks. We found --

11           **MR. TILLER:** Objection, Your Honor. Objection.

12           **THE COURT:** I heard that part. Basis?

13           **MR. TILLER:** Hearsay.

14           **THE COURT:** Oh. Overruled. Go ahead.

15           **THE WITNESS:** Yes, we saw all three peaks. There was  
16 a DABCO peak and then the two impurity peaks at exactly the  
17 right mass, exactly the right positions for what -- I'm sorry,  
18 exactly the right mass for what we wanted -- what we were  
19 seeking, what we were looking for.

20   **BY MS. BALZER:**

21   **Q.** What did Syngenta do next?

22   **A.** We wanted to absolutely confirm that the DABCO-related  
23 impurities were -- could only come from adding DABCO into the  
24 final step of the condensation stage of the process, so we went  
25 into the laboratory and generated a sample of impurities

1 starting with materials that are --

2 **Q.** These impurities that you are referring to particularly  
3 here, are those the two byproducts that result from the  
4 condensation step of the reaction?

5 **A.** Yes, they are. Yes. We started with materials that are  
6 present at the start of the condensation step. We added DABCO  
7 into them and we prepared --

8 **Q.** Dr. Whitton, if --

9           **THE COURT:** Okay. If you can stop interrupting him.

10           **MS. BALTZER:** I was just going to ask him to slow  
11 down a little bit for the jury's sake.

12           **THE COURT:** That would be helpful, but please let him  
13 finish his answers.

14           **THE WITNESS:** So we started with impurities on  
15 materials that were in the reaction stage for the process. We  
16 then added DABCO into them; and we completed the reaction,  
17 worked up, purified to get a very clean product; and then we  
18 sent them -- we had them analyzed to determine the exact  
19 structure of the molecules.

20 **BY MS. BALTZER:**

21 **Q.** What did Syngenta do after that?

22 **A.** We --

23           **MR. TILLER:** Objection. Can I approach really quick?

24           **THE COURT:** Okay.

25           (Bench conference as follows:)

1                   **MR. TILLER:** He said "we had them analyzed," which  
2 leads me to believe that somebody else other than Syngenta did  
3 it.

4                   **MS. BALTZER:** He oversaw it. He said that.

5                   **THE COURT:** Okay. Well, I'm not quite following his  
6 testimony, if he's talking about two different tests or just  
7 one. You just have to ask questions because I can't tell.

8                   (Bench conference concluded.)

9                   **THE COURT:** Go ahead.

10                  **THE WITNESS:** Yes, we had the --

11                  **THE COURT:** Wait a second.

12                  **THE WITNESS:** I'm sorry.

13                  **THE COURT:** I meant go ahead to the lawyer to ask you  
14 the question.

15                  **BY MS. BALTZER:**

16                  **Q.** Dr. Whitton, when you are saying "we had the testing  
17 done," are you referring to Syngenta did this testing?

18                  **A.** Syngenta did this testing, yes.

19                  **Q.** So after you referred to synthesizing these molecules,  
20 what did Syngenta do next?

21                  **A.** We used these molecules to absolutely confirm that apart  
22 from DABCO the other two peaks that we found in the Willowood  
23 samples were undoubtedly molecules that could only come from  
24 adding DABCO into the final condensation stage of the  
25 azoxystrobin process.

1   **Q.**   How did you do that?

2   **A.**   We used the LC-MS/MS analysis.

3   **Q.**   What did the results of that show?

4   **A.**   The results showed that the three peaks that DABCO -- the  
5   two impurities that could only come from adding DABCO into the  
6   final stage, the condensation stage of the process, to make  
7   azoxystrobin were definitely in there.

8   **Q.**   And when you say "in there," what are you referring to?

9   **A.**   They were in the sample as received from -- in the bottle  
10   from the Willowood production or the Willowood sample.

11   **Q.**   Dr. Whitton, I would like you to turn to Exhibits 6B, 6C,  
12   and 6D in your binder.

13   **A.**   Yes.

14   **Q.**   Do you recognize these documents?

15   **A.**   I do.

16   **Q.**   What are they?

17   **A.**   These are the raw machine data that came out from the  
18   LC-MS/MS testing of the Willowood samples and the subsequent  
19   follow-up testing. They also include the raw machine data from  
20   other tests that we did to confirm the structures of the  
21   material. The tests nuclear magnetic resonance, NMR, and  
22   infrared, these were used to fully characterize the two  
23   impurities that we made in the lab.

24                   And the final one, 6C, were the tests that hundred  
25   percent confirmed that those impurities were -- the two

1 impurities that we made in the lab were identical to the two  
2 impurities that we found in the Willowood sample and could only  
3 have come from putting DABCO into the final stage, the  
4 condensation stage, of the azoxystrobin process.

5                   **MS. BALTZER:** I move for admission of Plaintiff's  
6 Exhibits 6B, 6C, and 6D.

7 THE COURT: Six --

8 MS. BALTZER: 6B, 6C and 6D.

9 THE COURT: They'll be admitted.

10 MS. BALTZER: No further questions, Your Honor.

11 THE COURT: For Willowood.

12 || CROSS-EXAMINATION

13 | BY MR. TILLER:

14 Q. Dr. Whitton, this test was run once, right?

15 A. This test was run several times.

16 Q. I only see evidence of this test being run once.

17 A. The test was run -- I think Test 6B was run 18th of  
18 February and 6C was run 11th of May.

19 Q. 6C is the testing of the byproducts?

20 **A.** That's the final testing of the byproducts, yes.

21 | Q. And 6B was the identification of DABCO, right?

22 **A.** 6B was the identification of DABCO. Plus, also we saw the  
23 peaks from the DABCO-related impurities that could only come  
24 from the final step -- DABCO in the final step of the process.

25 Q. And then those -- that alleged DABCO-related impurities

1 were then tested in May?

2 **A.** Correct.

3 **Q.** Okay. But -- so one sample of Azoxy 2SC was tested,  
4 correct?

5 **A.** One sample of Azoxy 2SC.

6 **Q.** That's what I mean when --

7 **A.** I apologize. Yes, we've done it several times and  
8 confirmed the results several times.

9 **Q.** Let me ask the question. This data reflects that one  
10 sample of Azoxy 2SC was tested, correct?

11 **A.** Yes, a sample purchased from the US.

12 **Q.** And this was -- you didn't send this out to an independent  
13 lab to be tested, did you?

14 **A.** No, we did not.

15 **Q.** Okay. And with this testing, to the extent that there was  
16 DABCO, you were not able to determine how much DABCO was used  
17 in the condensation step, correct?

18 **A.** That's correct. We --

19 **Q.** And, in fact --

20                   **THE COURT:** Wait just a second. If you can just  
21 answer yes or no.

22                   **THE WITNESS:** Correct.

23 **BY MR. TILLER:**

24 **Q.** You were not able to determine how much was used in the  
25 condensation step, correct?

1   **A.**   Correct.

2   **Q.**   Okay. And, in fact, to the extent that you were able to  
3 quantify how much was in here, it was far, far below what would  
4 be indicative of 0.1 molar percent, correct?

5   **A.**   That's good because we don't want to have --

6   **Q.**   Thank you.

7   **A.**   -- any impurities in the product, so we need to wash it  
8 out throughout the process. So we put in the amount we put in  
9 and as we go through the process, it diminishes --

10                 **MR. TILLER:** Your Honor.

11   **A.**   -- and in the final crystallization it is taken out.

12                 **THE COURT:** Okay. Stop.

13                 What was your question?

14                 **MR. TILLER:** It was a yes or no question.

15                 **THE COURT:** Can you just repeat it?

16                 **BY MR. TILLER:**

17   **Q.**   The amount -- to the extent you identify DABCO, the amount  
18 of DABCO that was identified in the sample was far below the  
19 0.1 molar percent claimed in the '761 patent, correct?

20                 **THE COURT:** Just answer if that's correct.

21                 **THE WITNESS:** That's correct.

22                 **MR. TILLER:** I have nothing further, Your Honor.

23                 **THE COURT:** Any redirect?

24

25

## 1                   REDIRECT EXAMINATION

2   **BY MS. BALTZER:**

3   **Q.**   Dr. Whitton, why is it that -- the amount of DABCO that  
4   you detect in an LC-MS/MS test like this on an end-use  
5   formulated azoxystrobin product, why is it at the level that's  
6   far below .1 mol percent?

7   **A.**   When you put this material in -- the DABCO into the  
8   process, you put it in, you get various -- as I said before, no  
9   reaction is a hundred percent. You get some of this DABCO  
10   going into the DABCO-related impurities. You also get DABCO  
11   disappearing in the water washes in there; and in the final  
12   crystallization, most of any DABCO that remains goes out. So  
13   it's entirely consistent that we wouldn't see the total amount  
14   that we put in.

15                 **MS. BALTZER:**   Thank you, Dr. Whitton.

16                 No further questions.

17                 **THE COURT:**   All right. Anything else about that?

18                 **MR. TILLER:**   One very quick question.

## 19                   RECROSS-EXAMINATION

20   **BY MR. TILLER:**

21   **Q.**   Based on that number -- based on that test, again, you  
22   could not identify how much DABCO was used in the condensation  
23   reaction, right?

24   **A.**   The reasonable amount of DABCO to put in is 1 percent.

25   **Q.**   Could you find --

1                   **MR. TILLER:** And I'd ask for that to be stricken. He  
2 hasn't been identified as an expert.

3                   **THE COURT:** All right. Sustained. You all just  
4 disregard that.

5 You can repeat your question.

6 | BY MR. TILLER:

7 Q. You cannot identify how much DABCO was used in the  
8 condensation reaction that was used to make the Willowood Azoxy  
9 2SC that you tested once?

10 A. No, I cannot.

11 || MR. TILLER: Nothing further.

12 THE COURT: Okay. Thank you. You can step down.

13 || (The witness left the stand.)

14 THE COURT: You can call your next witness.

15 || MR. SANTHANAM: We're going to call Dr. Joseph

16 Fortunak. Before he takes the stand, we have some courtesy  
17 binders.

18 THE COURT: All right.

19 DR. JOSEPH FORTUNAK,

20 PLAINTIFF'S WITNESS, SWORN AT 2:10 P.M.

21 DIRECT EXAMINATION

22 BY MR. SANTHANAM:

23 Q. Good afternoon, Dr. Fortunak. Can you please state your  
24 full name for the jury?

25 A. Joseph Marion Fortunak.

1                   **THE COURT:** Wait. That mic is not picking up. I  
2 don't know --

3                   **THE WITNESS:** Joseph Marion Fortunak.

4                   **THE COURT:** That's better. Thank you.

5 **BY MR. SANTHANAM:**

6 **Q.** Can you tell us who you work for?

7 **A.** Howard University in Washington.

8 **Q.** Can you briefly give us a little bit of your background?  
9 We'll get into it, but tell us a little bit about your  
10 background.

11 **A.** A little bit is that I'm a process chemist. I'm a  
12 professor at Howard University. I teach in the Department of  
13 Chemistry and I teach pharmaceutical sciences over in pharmacy  
14 as well.

15 **Q.** Without getting into the details, can you tell us why you  
16 are here today?

17 **A.** Yes. I'm here to offer you my opinions on technical  
18 matters that are related to the case that we're litigating now.

19 **Q.** Have you been retained by Syngenta?

20 **A.** Yes, I have.

21 **Q.** Are you being compensated for your work on this case?

22 **A.** Yes. I'm being paid \$525 an hour and that compensation is  
23 not related in any way to the outcome of the litigation.

24 **Q.** Now, Dr. Fortunak, I promise you, we'll get to your  
25 background. Can you tell us what you do at Howard University?

1   **A.**   I'm a professor. I teach undergraduate and Ph.D. level  
2 courses. I teach chemistry, pharmaceutical sciences, green  
3 chemistry, chemical synthesis, medicinal chemistry; and I have  
4 a research group; and I work with other organizations that have  
5 a need for process chemistry and other sorts of development  
6 issues that are chemical in nature.

7   **Q.**   You mentioned that you are a process chemist. Can you  
8 explain what that is?

9   **A.**   Well, if you are doing chemistry, you can do it -- you can  
10 think about it on paper and you can see what might work. You  
11 can do it in the laboratory. I think we talked about it before  
12 in terms of like a jam jar, making just a little bit of  
13 something; but if you want to make something that is a product  
14 that goes into the marketplace, it takes a lot because there is  
15 an awful lot of chemistry that goes into things from making  
16 suits to food to crop protection to drugs; and that's where  
17 process chemists come in. It's their job to translate these  
18 things from a little, tiny scale to something that can be used  
19 commercially.

20   **Q.**   Can you tell us a little bit about your educational  
21 background?

22   **A.**   I have got a bachelor's degree in chemistry from Purdue  
23 University. I have a Ph.D. from the University of Wisconsin,  
24 Madison. I did post-doctoral work as a research assistant  
25 professor at Cambridge University in England.

1   **Q.**   Is there a particular field of chemistry that you're  
2 involved in?

3   **A.**   I'm a process chemist, so yes.

4   **Q.**   And I think you mentioned the phrase "organic chemistry."  
5 Can you tell us what that is?

6   **A.**   Sure. Organic chemistry, it's always been the chemistry  
7 of life, but along the way people figured out that all living  
8 things -- most of that chemistry is dependent on the chemistry  
9 of carbon. So the chemistry of carbon and bonding to other  
10 carbon atoms and bonding to other atoms, especially hydrogen  
11 and a few others like oxygen and sulphur, is what is really  
12 important in organic chemistry.

13   **Q.**   Dr. Fortunak, we've been hearing a lot about this compound  
14 called azoxystrobin. Would you call that an organic compound?

15   **A.**   Yes, it is an organic compound.

16   **Q.**   Is the chemistry related to that organic chemistry?

17   **A.**   It's organic synthesis and it's process chemistry as well.

18   **Q.**   Do you have any industry experience?

19   **A.**   I do. I had 21 years of industry experience before I  
20 joined Howard 13 years ago.

21   **Q.**   Can you tell us, as part of that industry experience, have  
22 you invented any compounds?

23   **A.**   Yes. I worked in the pharmaceutical industry. I -- the  
24 chemistry that I worked on launched 15 new drugs and drug  
25 device combinations, and I've also helped launch 25-plus new

1 generic products. So that's a fair measure of the number of  
2 times that I've been through these kinds of processes of, like,  
3 inventing the chemistry and then moving it up to scale, moving  
4 it into production.

5 **Q.** And can you tell us a little bit about the work that  
6 you've done in taking processes from small scale to a large  
7 commercial scale?

8 **A.** Well, yeah. Whenever you've got a new project, you need  
9 to -- it's -- you are looking at a molecule and, of course,  
10 that's where the chemists get excited, right? And you start  
11 off with paper chemistry: How many different ways could I  
12 possibly make this molecule? Which ones are -- they're  
13 conservative, but they'll probably work? Which ones are really  
14 exiting, but they're risky? Which ones are too expensive?  
15 Which ones might be safe and which ones are most likely to blow  
16 up and which ones should I start working on to see if I can  
17 supply what is needed to keep the product in development?

18 **Q.** You used the phrase "paper chemistry." Can you tell us  
19 what you mean by that?

20 **A.** Paper chemistry is something that -- you can look at the  
21 prior art or you can invent new chemistry into your mind and  
22 you can write it all down on paper, but you don't really know  
23 if it works yet.

24 **Q.** Dr. Fortunak, as part of your work in industry and your  
25 current work, have you been involved in developing analytical

1 methods or using analytical methods?

2 **A.** Yes, because you use analytical methods to test your  
3 reactions pretty much every time you run one. You need to know  
4 whether or not the reaction is going and whether or not it is  
5 making product that you want. So I've used analytical methods  
6 pretty much every day of my professional life.

7 **Q.** Okay. Have you been involved in the regulatory side of  
8 bringing a product to market?

9 **A.** I have, certainly more so on the FDA side than on the EPA  
10 side. And the EPA, I've only been involved with environmental  
11 health and safety and things like environmental impact  
12 statements, but, yes.

13 **Q.** We've been talking generally about your industry  
14 experience. Can you give us a few examples of where you've  
15 worked in industry?

16 **A.** I spent 10 years at Glaxo -- it used to be SmithKline  
17 Beecham. Now, it's GlaxoSmithKline. I worked for eight years  
18 at DuPont Pharmaceuticals. And after DuPont was sold, I spent  
19 four years as the head of global -- used to be called Global  
20 Process Chemistry, then it became Global Chemical Development  
21 at Abbott Labs.

22 **Q.** And over the course of your industry experience, have you  
23 been involved -- have you been in charge of any production  
24 facilities?

25 **A.** Yes. I think I've probably run, oh, somewhere between 8

1 and 12 production facilities.

2 **Q.** And, Dr. Fortunak, have you received any awards or  
3 recognitions for your work?

4 **A.** Yes. In 2009, I got the American Chemical Society Award  
5 for chemistry impact on human health. In 2013, we received an  
6 FDA Honor Award for excellence in innovation in Africa. And in  
7 2014, I got an African Union Award for corporate social  
8 responsibility.

9 **Q.** Now, have you published any of your work?

10 **A.** I have about 75 peer-reviewed publications.

11 **Q.** Do you have any patents in your name?

12 **A.** I think I have 17 issued US patents and about an equal  
13 number of patents that, for one reason or another, were only  
14 issued in foreign countries.

15                   **MR. SANTHANAM:** Your Honor, at this time, we'd tender  
16 Dr. Joseph Fortunak as an expert in organic chemistry and  
17 process chemistry.

18                   **THE COURT:** Any questions about his qualifications?

19                   **MR. TILLER:** No, Your Honor.

20                   **THE COURT:** All right. He may so testify.

21 **BY MR. SANTHANAM:**

22 **Q.** Now, Dr. Fortunak, in preparing to testify at trial today,  
23 did you prepare any materials to help you explain your  
24 testimony to the jury?

25 **A.** I did, because I'd like to talk about chemistry, and it's

1 much easier to look at something instead of just listen to  
2 words when we're talking about chemistry. So I'd like to show  
3 those as -- I guess it's a demonstrative, right?

4 **Q.** So there are two binders in front of you. One of them  
5 should have your name on it. And if you could turn to the  
6 first tab -- under the first tab, there should be what has  
7 previously been marked for identification as Plaintiff's  
8 Demonstrative Exhibit 27. Do you see that?

9 **A.** Yes, I do.

10 **Q.** Are these the materials that you prepared?

11 **A.** Yes.

12 **Q.** Do they fairly and accurately summarize the work that  
13 you've done in connection with this matter?

14 **A.** Yes, they do.

15 **Q.** Do they fairly and accurately summarize any opinions or  
16 conclusions that you've reached?

17 **A.** Yes, that's why I prepared them.

18                   **MR. SANTHANAM:** Your Honor, permission to put up the  
19 Plaintiff's Demonstrative Exhibit 27.

20                   **THE COURT:** All right.

21 **BY MR. SANTHANAM:**

22 **Q.** Now, Dr. Fortunak, we've been talking about your  
23 background. We've been talking about your background, and are  
24 you familiar with this concept of a person of ordinary skill?

25 **A.** Yes, I am.

1   **Q.**   And can you tell us what a person of ordinary skill is?

2   **A.**   So a person of ordinary skill is someone who can -- that  
3   can read a patent and they understand what the invention is.  
4   And without undue experimentation, they could reproduce what  
5   the invention is, given what's in the patent itself.

6   **Q.**   Okay. And have you prepared any materials to help explain  
7   what a person of ordinary skill is with respect to the work  
8   that you've done on this case?

9   **A.**   Could we turn to -- we've got overheads here. Could we  
10   get to the one that says, person of ordinary skill in the art?

11   **Q.**   And before we get there, you have -- have you reviewed  
12   each of the Syngenta patents that are asserted in this case,  
13   the compound patents, the '138 process patent and the '761  
14   DABCO patent?

15   **A.**   Yes, I have.

16   **Q.**   And having reviewed those materials, can you tell us who a  
17   person of ordinary skill in the art is?

18   **A.**   Sure. I believe it's someone who has -- well, first of  
19   all, they have to have a degree in chemistry, and so, someone  
20   who has a bachelors degree in chemistry or chemical engineering  
21   or something that's related to that; and then, about two to  
22   three years -- a few years of experience in actually  
23   synthesizing organic molecules after that; or, if you have a  
24   slightly higher degree, a masters degree, for instance, maybe a  
25   little less experience is necessary, one to two years in

1 synthesizing organic molecules.

2 **Q.** Now, Dr. Fortunak, do you believe that you're at least at  
3 a level of a person of ordinary skill in the art?

4 **A.** I do. And I believe I've actually trained people to  
5 become those of ordinary skill in the art.

6 **Q.** Now, have you been present at this trial throughout the  
7 testimony of other witnesses?

8 **A.** I have.

9 **Q.** And were you present yesterday when Dr. Mark Lipton  
10 testified about a person of ordinary skill in the art?

11 **A.** Yes, I was.

12 **Q.** Do you agree with Dr. Lipton's definition of a person of  
13 ordinary skill in the art?

14 **A.** Well, generally. But Dr. Lipton also says that to be of  
15 ordinary skill in the art, you'd have to have some years of  
16 experience working in agrochemicals, I think in -- was it  
17 synthesizing and testing them? And I don't believe that that's  
18 necessary to understand the invention.

19 **Q.** Do you believe that your opinions are consistent with both  
20 your definition and Dr. Lipton's definition of a person of  
21 ordinary skill in the art?

22 **A.** Well, it doesn't matter which definition would hold, my  
23 opinions would be the same.

24 **Q.** I'd like to talk about the '761 DABCO patent.

25 **A.** Could we change slides, then?

1   **Q.**   Have you reviewed -- first of all, have you had a chance  
2   to review and analyze that patent?

3   **A.**   Yes, I have.

4                 **MR. SANTHANAM:**   David, if we could go to Slide 27.4.

5   **BY MR. SANTHANAM:**

6   **Q.**   Briefly, Dr. Fortunak, can you tell us what the '761 DABCO  
7   patent is generally about?

8   **A.**   Sure. Well, the '761 patent says this is a way of making  
9   azoxystrobin. And we're going to do that last step, the  
10   condensation step, using DABCO as a catalyst, but it's within a  
11   stipulated range of between 0.1 mol percent and 2 mol percent.

12   **Q.**   And in -- you used this term "DABCO as a catalyst." What  
13   is a catalyst?

14   **A.**   A catalyst is something that -- it lowers the energy.  
15   Strictly, the definition of a catalyst is something that lowers  
16   the energy of activation for a reaction to occur so it occurs  
17   easier.

18   **Q.**   And Dr. Fortunak, you specifically mentioned this phrase  
19   "mol percent." Can you explain for us what that is, if you  
20   can?

21   **A.**   Well, we've heard it -- you've heard it through the trial,  
22   talking about mols. And it's a way of relating molecules and  
23   weight. And so, for instance, if you were going to react equal  
24   amounts of A and B together, and they were going to couple to  
25   make a product, equal numbers of molecules wouldn't weigh the

1 same because they have different molecular formulas. And so, a  
2 mol percent is a way of relating, adjusting for the differences  
3 in the molecular formula and the molecular weights so we know  
4 how much of these things to react with each other.

5 **Q.** And Dr. Fortunak, are there reasons why you would want to  
6 use DABCO as a catalyst to make azoxystrobin?

7 **A.** Sure, and I've listed them here. You can see the  
8 advantages of using DABCO as catalyst. One of them is that it  
9 improves the yield. So if you put in 100 molecules of each  
10 reacting partner, if you use -- if you don't use DABCO, you're  
11 going to get fewer product molecules that come out, so you  
12 improve the overall yield. 100 percent is a perfect yield.  
13 Everything's going to the desired product. You get closer to  
14 100 percent yield that way.

15 **Q.** Are there other advantages?

16 **A.** Sure. Because it's a catalyst, well, it lowers -- it  
17 increases -- the rate of the reaction happens faster, and so  
18 you can actually lower the temperature where the reaction  
19 occurs, and that does two extra things for you. It reduces the  
20 number of impurities that are in the reaction. And that --  
21 that's a consequence, also, of the yield getting higher.

22 But another thing is that if you reduce the  
23 temperature, you don't have to have as much energy input to do  
24 the work, and it's cheaper to run, and it's safer, particularly  
25 with azoxystrobin, because we know there's some instability

1 with temperature of one of the reacting partners that condenses  
2 to form this azoxystrobin technical.

3 **Q.** Have you looked into what disadvantages might occur if you  
4 use DABCO outside of the claimed range?

5 **A.** Yeah. And well, you know what? I've got a table for  
6 that. Could we go to the -- there's a next overhead here.

7 **Q.** Can you explain what disadvantages are there using DABCO  
8 outside of the claimed range?

9 **A.** Well, this table, most of it is taken from Table 1 of the  
10 '761 patent, the first two columns. What it does is it  
11 compares the amount of DABCO that you use and the yield of the  
12 reaction. Those are the first two columns.

13 I put in the third column that shows the reaction  
14 time. And, you know, forgive me, I'm so tempted -- well, so  
15 I'll say it. What we want to take away from this is there's  
16 really two major advantages of using DABCO in the claimed  
17 range. One is that you can maximize the yield. And the other  
18 one is that you can minimize the reaction time. And reaction  
19 time is important when you have to make a lot of something or  
20 if you're in a manufacturing facility.

21 In the manufacturing facility that I was last running  
22 in the United States, it was \$2,000 an hour for running a  
23 reaction. So if you run a reaction for a shorter period of  
24 time, it's less expensive. But, you can also turn out more in  
25 a day if the reaction time's shorter.

1   **Q.** Now, Dr. Fortunak, were you here just right before you  
2 took the stand, for the testimony of Dr. Alan Whitton?

3   **A.** Yes.

4   **Q.** And were you -- did you hear his testimony about testing  
5 that Syngenta performed --

6   **A.** Yes, I did.

7   **Q.** -- on -- excuse me, on samples of Willowood Azoxy 2SC?

8   **A.** Yes, I heard.

9   **Q.** There's a second binder in front of you. And in that  
10 binder, there should be tabs for what's been marked as  
11 Plaintiff's Trial Exhibit 6B, 6C, and 6D. Do you see those?

12   **A.** I do.

13   **Q.** And have you reviewed these materials as part of your work  
14 in this case?

15   **A.** Yes, I have.

16   **Q.** I'd like -- and are you familiar with what Syngenta's  
17 testing?

18   **A.** Yes, I am.

19   **Q.** I'd like to talk -- before we get into those results, I'd  
20 like to talk generally about the analytical procedures or  
21 methods that were used. Are you familiar with those methods?

22   **A.** Yes, I am.

23   **Q.** And can you briefly tell us what those methods are.

24   **A.** So bear with me here, because I'm a professor, right, we  
25 can't -- we love to talk about stuff. Can we go to the next

1 overhead? This is one that -- so high-performance liquid  
2 chromatography, used to be called high-pressure liquid  
3 chromatography, was used. This is a technique that's used to  
4 separate out the components of a mixture.

5 So if we relate it to what's going on here with  
6 azoxystrobin, what you see is that the biggest component in a  
7 mixture is azoxystrobin, but you're also going to see little,  
8 tiny impurities that are present, and you can separate them by  
9 this high-performance LC.

10 Now, the second thing that's used is mass  
11 spectrometry. And you also heard from Dr. Whitton that you can  
12 put two of these together as a technique called MS/MS. And  
13 what mass spectrometry is, is you put a whole lot of energy  
14 into a molecule. Sometimes, you pound it with high-energy  
15 electrons. But what happens then is that the molecule ionizes  
16 and it gets charged. And as a consequence of that, you can  
17 tell what its exact mass is, so you can tell what the molecular  
18 formula is.

19 **Q.** And there are other techniques that you mentioned -- that  
20 are mentioned, infrared spectroscopy and nuclear magnetic  
21 resonance spectroscopy. Do you know if Syngenta performed  
22 those procedures?

23 **A.** Yes.

24 **Q.** Dr. Fortunak, I'd like to have you walk us through some of  
25 these a little bit -- in the interest of time, quickly -- but I

1 also would like to have the Court understand at a high level  
2 what these are. Can you explain for us what chromatography is?

3 **A.** So chromatography is that you make a solid support. And  
4 in a simple column, it might be just finely ground sand. You  
5 put sample on there that you want to separate things, and  
6 that's the stationary phase. And you wash the sample down the  
7 stationary phase with a solvent. And if you look in the middle  
8 there, you can see three different colored bands. That  
9 represents that there would be three different components in a  
10 mixture, and as the solvent runs down the column, those -- the  
11 components in the mixture, they flow at different rates, so  
12 they separate.

13           And, then, as you see the fourth and fifth, as we go  
14 from left to right, those -- the bands elute, so you can  
15 separate the different components, and that's a lead to  
16 identifying them.

17 **Q.** Dr. Fortunak, you mentioned this phrase high-performance  
18 liquid chromatography. Again, very briefly and at a high  
19 level, can you explain what that is?

20 **A.** Sure. High-performance liquid chromatography means you do  
21 all of this under very high pressure. And what happens is you  
22 get really good power to separate the components in a mixture,  
23 and you can tell, very small amounts, what's present. And you  
24 you've got -- an LC is represented over on the left, but if you  
25 look on the right, what's important is you can look at a

1 chromatogram, and what it looks like is that you look at how  
2 much time it takes for the sample to run down the column, and  
3 you see peaks whenever one of the components comes off the  
4 column.

5 **Q.** Now, you also mentioned this phrase, LC-MS/MS. Can you  
6 explain what that is at a high level?

7 **A.** Yes. So what you do, then, is you combine the LC, and as  
8 the components come off of the LC, you put them on mass  
9 spectrometer, they get ionized, and you can tell what the  
10 molecular formula is.

11 Then, those ions, they fragment into smaller ones.  
12 And you can take each one of those ions, and you can put it in  
13 a second mass spec and watch it fragment further. The  
14 importance of all of that is that it's sort of like forensic  
15 evidence. You can put it all back together, like the pieces of  
16 puzzle, and you can come up with structure of what the molecule  
17 is that's a component in the mixture.

18 **Q.** Can you explain for us what -- at a high level, infrared  
19 spectroscopy and nuclear magnetic resonance spectroscopy are?

20 **A.** Well, once you've got a sample, you also want to have more  
21 information about what a structure is. Infrared spectroscopy  
22 is really low energy. And what happens is that you're sort of  
23 bending and tickling. You're tickling the molecule, and the  
24 bonds bend and stretch, and that gives you a different kind of  
25 information. And I've used caffeine to represent so you can

1 see the infrared spectrum of caffeine that's shown here on this  
2 overhead.

3 **Q.** What about nuclear magnetic resonance spectroscopy?

4 **A.** Well, there's two basis kinds of NMR that I'm going to  
5 talk about. One of them is carbon, and the other one is H --  
6 hydrogen, or proton, NMR. And carbon nuclear mass resonance  
7 allows you to find out what the skeletal structure of all of  
8 the carbons that make up the molecular framework are, and  
9 proton NMR lets you find out where the hydrogens are attached  
10 to the carbons and how many there are at each site and where  
11 they're attached to other atoms as well.

12 **Q.** Dr. Fortunak, is there any benefit to using all of these  
13 techniques together?

14 **A.** Well, you want to use them to get as much information as  
15 possible so you have the surest confirmation of the structure.  
16 But, another thing is, all of these pieces of evidence need to  
17 hang together so that you can be confident that you've got the  
18 right structure identified.

19 **Q.** And did you, in reviewing Syngenta's testing data, were  
20 you able to look through and see all of the results from these  
21 various methods?

22 **A.** Yes. In fact, there were some other techniques as well  
23 that are even more esoteric.

24 **Q.** And, Dr. Fortunak, have you been able to reach any  
25 conclusions based on Syngenta's testing of Willowood's Azoxy

1 2SC?

2 **A.** Yes, I have.

3 **Q.** And can you describe for us what that -- what that testing  
4 shows?

5 **A.** So the testing shows a few things. It shows that there  
6 was DABCO in the Willowood Azoxy 2SC. Another thing it shows  
7 us is that that DABCO had to be present in the condensation  
8 step.

9 **Q.** Can you explain why that is?

10 **A.** Yeah. That's because what happens is that the DABCO --  
11 there's no such thing as the perfect catalyst. They don't last  
12 forever. You know, all of these little -- every time you run a  
13 DABCO reaction, like the '761 patent reaction, every once in a  
14 while, a molecule of DABCO gets high-jacked and it reacts with  
15 the other partners that would otherwise make azoxystrobin. So  
16 DABCO gets incorporated into a byproduct.

17 And what you could do is you could use those as  
18 fingerprints. There's low levels of them in a condensation  
19 reaction if you use the DABCO. And what happened in -- the  
20 Syngenta testing results showed that there were two byproducts,  
21 1 and 2, that incorporated the DABCO into them. So they were  
22 identified by LC-MS/MS. And what happens is that if you see  
23 DABCO there, and you see these by products, you know that DABCO  
24 had to come from that condensation step.

25 **Q.** Dr. Fortunak, is there any way that the DABCO might have

1 come from other sources, one of the other components that go  
2 into Willowood Azoxy 2SC?

3 **A.** Well, no, for multiple reasons.

4 **Q.** Can you explain?

5 **A.** Well, I've looked at a list of the excipients, the  
6 adjuvants that go into this formulation. None of them is  
7 DABCO. DABCO is not present naturally, so it shouldn't be in  
8 there accidentally. DABCO isn't used in the manufacture of any  
9 of the adjuvants that go into the formulation. And these  
10 fingerprint impurities, they tell us that the DABCO had to be  
11 introduced at the condensation step.

12 **Q.** Now, Dr. Fortunak, is there any way that DABCO and 2DABCO  
13 byproducts such as the ones that you observed could be found in  
14 Willowood Azoxy 2SC, and that DABCO is not used in the  
15 condensation step?

16 **A.** No.

17 **Q.** Now, in order to give the jury a brief understanding of  
18 what these test results are, I'd like to walk through some of  
19 those results. And you've reviewed those results that are in  
20 your binder, is that right?

21 **A.** That's correct.

22                   **MR. SANTHANAM:** David, if you could put up  
23 Plaintiff's Trial Exhibit 6B for us, and what we have here is  
24 the first page, which is SYN 10181.

25 **BY MR. SANTHANAM:**

1                   **MR. SANTHANAM:** David, can we go to SYN 10188.

2                   **BY MR. SANTHANAM:**

3                   **Q.** And, Dr. Fortunak, can you explain what we're seeing here.

4                   **A.** So this is where there's a peak that elutes that has an  
5 exact mass that is -- that's got the molecular formula of  
6 Byproduct 2 that was found in the Azoxystrobin 2SC.

7                   **Q.** And when you say Byproduct 1 and Byproduct 2, are these  
8 the same byproducts that you referred to before as being formed  
9 in the condensation reaction?

10                  **A.** That's correct, and they're the ones that I wanted to  
11 confirm that Dr. Whitton and his group had identified.

12                  **Q.** And you also mentioned infrared spectroscopy and nuclear  
13 magnetic resonance spectroscopy. Can you turn to Plaintiff's  
14 Trial Exhibit 6C -- 6B, excuse me. Actually I think it's 6C.  
15 Can you tell us if that's -- 6D.

16                  **A.** I think we're 6D, aren't we?

17                  **Q.** Can you tell us if that's what you're referring to in  
18 terms of data from nuclear magnetic resonance spectroscopy and  
19 IR spectroscopy.

20                  **A.** Yeah, so remember, you can't be saying I just -- I got a  
21 molecular formula, I know it's the right stuff. You have to --  
22 so what the Syngenta folks did is they went back and in the  
23 laboratory they did the reaction with DABCO in there, and they  
24 isolated these impurities so that they could get a good  
25 characterization on them, prove what they were using these NMR

1 techniques and infrared.

2           Then what they did is they took those samples and  
3 they co-injected them with the Azoxy 2SC to show that they  
4 eluted at the same place so you could get proof that the  
5 byproducts were the right byproducts.

6 **Q.** Now, Dr. Fortunak, you used this term fingerprint before.

7 What do you mean by that?

8 **A.** So, well, a fingerprint is -- it's characteristic, it's  
9 something -- to me it's something that I got -- that I have  
10 inherent in my fingers, and this is -- I'm calling it a  
11 fingerprint because it's inherent in what happens in a  
12 reaction.

13           If you're going run the azoxy condensation step with  
14 DABCO, you're going to generate some of these fingerprint  
15 impurities, and you should see them at low levels.

16 **Q.** Dr. Fortunak, have you reached a conclusion, based on your  
17 background in process chemistry and analytical methods, to a  
18 reasonable degree of scientific certainty, as to whether DABCO  
19 is used in the condensation reaction that's used to make  
20 Willowood's azoxystrobin technical?

21 **A.** Yes, I have.

22 **Q.** What is that conclusion?

23 **A.** I'm completely convinced. The azoxystrobin technical that  
24 was in the Azoxy 2SC, it was made by a process that has DABCO  
25 in it.

1   **Q.** Now, Dr. Fortunak, switching to a slightly different  
2 topic. Were you here yesterday when Dr. Mark Lipton testified  
3 about the Weintritt reference and the validity of the '761  
4 DABCO patent claims?

5   **A.** Yes, I was.

6   **Q.** Now, do you believe that the '761 -- the Weintritt  
7 reference invalidates or renders obvious the '761 DABCO patent  
8 claims?

9   **A.** No, I don't believe that.

10   **Q.** And can you explain why that is.

11   **A.** Yes. On -- I actually have some more demonstratives on  
12 that if we can take a look at them. Actually, could  
13 we -- thank you. I was going to -- what this is is I've  
14 pulled, as we saw with Dr. Lipton, this figure out of the  
15 Weintritt patent. So, again, I wanted to use Dr. Lipton's --  
16 he described to us that Weintritt's claims refer to uncountable  
17 numbers of compounds. Let's just say that there's billions of  
18 possibilities here, okay?

19   **Q.** And, for the record, I'm going to put up what was marked  
20 as Plaintiff's Demonstrative 26. Is this what you're referring  
21 to, Dr. Fortunak?

22   **A.** Oh, yeah. But I don't think Dr. Lipton drew that up.

23   **Q.** And can you tell us what you mean by there could be  
24 uncountable numbers of molecules that were represented by this  
25 formula in Weintritt.

1   **A.**   Okay. Well, there's one kind of -- we can -- L1, 2, 3, 4  
2 and 5 that you can see, they can all be about 50 or more  
3 different things, 50 at a minimum. And since they're all  
4 interchangeably present, then we can have 50 times 50 times 50  
5 times 50, and then even if we just let L5 -- so L5, optionally  
6 it could be what they call the warhead piece of making these  
7 antifungal things.

8                 Bayer had one series of drugs that had a certain  
9 warhead on them, and azoxystrobin's got a different warhead,  
10 and in the Weintritt patent we referred to 13 different  
11 warheads. Well, it would be, you know, 50, 50, 50, times 50  
12 times 13. Those are the possibilities we have for different  
13 structures of that right-hand ring.

14                 And then X, X could be H, chlorine, fluorine and  
15 bromine. I don't think it could be iodine, but it's a halogen  
16 in H.

17   **Q.**   Dr. Fortunak, do you believe that a person of ordinary  
18 skill -- we talked about a person of ordinary skill. Do you  
19 believe that a person of ordinary skill would review Weintritt  
20 and would be led to making azoxystrobin?

21   **A.**   No. No, I don't.

22   **Q.**   And do you know if Weintritt has examples of making  
23 azox -- of any compounds -- withdrawn.

24                 Do you know if Weintritt has examples of making any  
25 compounds?

1   **A.**   Yes. Weintritt has five examples, and as you can see on  
2 the demonstrative, they don't make azoxystrobin. They make  
3 other compounds.

4   **Q.**   Now, Dr. Fortunak, we heard testimony from Dr. Lipton  
5 about combining the '138 patent, which talks about azoxystrobin  
6 with Weintritt. Would a person of ordinary skill in the art  
7 have any reason to combine the '138 patent with Weintritt?

8   **A.**   No. It creates a problem.

9   **Q.**   What is that?

10   **A.**   Well, it's -- I can explain it. Remember, making azoxy  
11 through the '138 patent, that's prior art, right, it's there.  
12 Well, azoxy there is made by -- it's a condensation -- it's an  
13 etherification step and then it's a condensation step.

14               Weintritt does two condensation steps. If you look  
15 at -- look at the ring that's got two ends in it. What  
16 Weintritt does is -- and forgive me, I'm going to assume you  
17 know a lot of organic chemistry now. Weintritt puts both of  
18 these AROs, right, to the left hand -- the left hand AR10 and  
19 it introduces the O with the ring and the L1 through L5. It  
20 introduces those sequentially in this same reaction. That's  
21 what Weintritt does.

22               But the '138 patent doesn't do that. The '138 patent  
23 opens up a methylene benzofuranyl, and then it reacts it with  
24 dichloropyrimidine, and it does the first condensation, then  
25 you isolate that intermediate. Then the '138 patent, you only

1 do the second condensation step. So what you'd actually have  
2 to do is to say I'm going to go backwards, and I'm going to  
3 actually include a new isolated intermediate so that I can then  
4 try and combine Weintritt with '138.

5 **Q.** Dr. Fortunak, we heard testimony that Weintritt discusses  
6 a condensation step. Is that the same condensation step as  
7 what's described in the '138 patent?

8 **A.** No, it's not.

9 **Q.** Now, assuming, for example, that a person of ordinary  
10 skill in the art would want to look at Weintritt and say I'm  
11 going to make azoxystrobin. Would that same person of ordinary  
12 skill in the art be led to using DABCO between levels of .1 mol  
13 percent and 2 mol percent as set forth in the DABCO patent?

14 **A.** I don't think so. It's -- yesterday we looked at page 6,  
15 paragraph 109, I think, of Weintritt.

16 **Q.** Do you want to look at the Weintritt reference? I think  
17 it's in your binder. Let me make sure. Yes. Exhibit 6. It's  
18 on the screen. Where did you want to go?

19 **A.** I think it's page six, paragraph 109.

20                   **MR. SANTHANAM:** David, can you blow that up.

21                   **BY MR. SANTHANAM:**

22 **Q.** What are we looking at here, Dr. Fortunak?

23 **A.** Well, this is actually a paragraph that we discussed  
24 during Dr. Lipton's testimony, and it's a discussion of the  
25 prior art and the Weintritt invention, okay. So what it's

1 saying is that previously it used to take a full mol equivalent  
2 or more of a tertiary amine to catalyze this reaction.

3           **THE COURT:** Say again.

4           **THE WITNESS:** It used to take a full mol equivalent  
5 or more of an tertiary amine to catalyze this type of a  
6 condensation.

7           **BY MR. SANTHANAM:**

8           **Q.** Is DABCO a tertiary amine?

9           **A.** Yes, it is.

10          **Q.** And what are the reasons you believe that a person of  
11 ordinary skill in the art would not use DABCO at the levels of  
12 .1 or 2 mol percent?

13          **A.** Well, the inventors say that they found, surprisingly,  
14 extremely surprisingly, that they could do this in the range of  
15 two to 40 mol percent. In addition to that, if we go below two  
16 mol percent, what they tell us is that using no DABCO, so  
17 that's without the addition of DABCO, and that is in the  
18 last -- the second to the last sentence. The product can only  
19 be isolated in very poor yields is the last sentence here.

20          **Q.** What does the combination of that information tell a  
21 person of ordinary skill?

22          **A.** Well, a person of ordinary skill would be thinking, okay,  
23 here's an invention but, you know what, this is as far as I can  
24 carry it. If I don't have any DABCO, then the reaction's going  
25 to be very poor. If i have two to 40 mol percent, it's

1 surprising that it works, but now that's here, I know it works.

2 **Q.** Dr. Fortunak, are you familiar with what's called the  
3 prosecution history, the file history?

4 **A.** Yes.

5 **Q.** Have you reviewed the file history of the '761 DABCO  
6 patent?

7 **A.** I have.

8 **Q.** And can you tell us generally whether the Weintritt  
9 reference and the '138 patent were considered during the  
10 prosecution before the patent office?

11 **A.** Yes, they were.

12 **Q.** And can you tell us what the end result of that was?

13 **A.** The end result, considering Weintritt and the '138 patent,  
14 these were presented by the inventors to the patent office,  
15 there was discussion back and forth and the patent was granted.

16 **Q.** Dr. Fortunak, in order for Weintritt and the '138 patent  
17 to validate the '761 DABCO patent, what would need to be true?

18 **A.** Okay. So Alan Whitton, and the other inventors on the  
19 '761 patent, well, they considered Weintritt when they applied  
20 for a patent, and they must have gotten it wrong; and in  
21 considering the file history, looking at the prior art, I must  
22 have gotten it wrong, too; but, most importantly, the patent  
23 examiner must have gotten it wrong.

24                   **MR. SANTHANAM:** No further questions, Your Honor.

25                   **THE COURT:** All right. How long do you think you'll

1 be?

2           **MR. TILLER:** Twenty, 25.

3           **THE COURT:** Okay. All right. Well, we'll go ahead  
4 take the afternoon break. Ladies and gentlemen, please come  
5 back at 10 minutes after three. Don't talk about the case or  
6 form an opinion. The jury's excused. Leave your notes in your  
7 chair.

8                     (At 2:50 p.m., jury leaves.)

9           **THE COURT:** Is this your last witness on rebuttal?

10          **MR. LEVINE:** Yes, Your Honor.

11          **THE COURT:** Yes? Okay. And are you all anticipating  
12 further evidence?

13          **MR. TILLER:** Probably no.

14          **THE COURT:** Okay. Well, just -- I won't hold you to  
15 that, I'm just trying to figure out the day. Well, it looks  
16 like we'll be in good shape then to let the jury go at the  
17 close of all the evidence, and we can proceed.

18                 Anything we need do before we take our recess? All  
19 right. We'll be in recess 15 minutes.

20                     (At 2:54 p.m., break taken.)

21                     (At 3:08 p.m., break concluded.)

22          **THE COURT:** Okay. We can bring the jury back in  
23 unless there's anything --yes?

24          **MR. LEVINE:** Yes, the Wu video we'll submit as  
25 Plaintiff's Exhibit 505 for purposes of the record. I move to

1 admit Plaintiff's Exhibit 505, the transcript of the Wu  
2 deposition designation that we played earlier, but it will not  
3 be in the notebook that goes back to the jury.

4                   **THE COURT:** All right. That will be admitted, to  
5 complete the record.

6 Anything else we need to take up? No. You can bring  
7 the jury in.

8 (At 3:09 p.m., jury present.)

9                   **THE COURT:** All right. I believe we were ready to  
10 turn to cross-examination, so you may proceed.

11 MR. TILLER: Thank you, Your Honor.

12 || CROSS-EXAMINATION

13 | BY MR. TILLER:

14 Q. Good afternoon, Dr. Fortunak.

15 A. Good afternoon, Mr. Tiller.

16 | Q. You understand what prior art is, don't you?

17 A. Yes, sir.

18 Q. And would you agree with me that prior art is a disclosure  
19 of some sort of public disclosure, whether it's in a patent, a  
20 patent application, or a journal, or a paper that's been  
21 written, that was published before the earliest application  
22 date for the patent to which you are comparing it to, correct?

23 A. That's correct.

24 Q. Okay. And you would agree with me that the '138 patent is  
25 prior art to the '761 patent, correct?

1   **A.**   I do agree with you.

2   **Q.**   And you would agree with me that Weintritt is prior art to  
3   the '761 patent, correct?

4   **A.**   That's correct.

5   **Q.**   Okay. At the time that the Weintritt application, which  
6   is -- you understand that the Weintritt application did  
7   eventually become a patent, correct?

8   **A.**   Yes, I do.

9   **Q.**   And that is owned by Bayer?

10   **A.**   Yes, I do.

11   **Q.**   And at the time that the Weintritt application published,  
12 DABCO was a well-known catalyst in organic synthesis, correct?

13   **A.**   That's correct.

14   **Q.**   Okay. And a person of ordinary skill in the art would  
15 have been familiar with DABCO and its catalytic defects at that  
16 time?

17   **A.**   That's correct.

18   **Q.**   And would you agree with me that someone skilled in the  
19 art, this person of ordinary skill in the art, would have found  
20 Weintritt, if looking for it, in, let's say, 2003 after it was  
21 published, if that person was studying improved processes to  
22 make azoxystrobin?

23   **A.**   That's an interesting consideration. I'm not sure about  
24 that, but possibly, yes.

25   **Q.**   Okay. I won't have to go -- we won't have to look at your

1 deposition.

2 Now, would you agree with me that Weintritt --  
3 despite the fact that you testified that it covers, I think you  
4 used the word, billions of potential compounds, Weintritt does  
5 disclose the synthesis of azoxystrobin in the presence of 2 to  
6 40 molar percent DABCO, correct?

7 **A.** It depends on what we mean by "disclose." It doesn't  
8 exemplify it; but out of the many compounds which are allowed  
9 for the synthesis in the Weintritt patent, azoxystrobin is one  
10 such compound.

11 **Q.** Okay. Just to make sure we're saying the same thing,  
12 while azoxystrobin is not specifically called out, a person of  
13 ordinary skill in the art would know that the disclosure as set  
14 forth in Weintritt would disclose azoxystrobin?

15 **A.** Correct.

16 **Q.** And the person of ordinary skill in the art would know  
17 that the scope of Weintritt's claims cover the synthesis of  
18 azoxystrobin in the presence of 2 molar percent to 40 molar  
19 percent DABCO during the condensation step, correct?

20 **A.** That is correct.

21 **Q.** And, in fact -- Bonnie, could we see DX-35, specifically,  
22 page 291896, please?

23 **MR. SANTHANAM:** Your Honor, we object to beyond the  
24 scope.

25 **MR. TILLER:** It's going to take two questions,

1 maybe --

2           **THE COURT:** Well, go ahead. Overruled.

3           **MR. TILLER:** Bonnie, if you could call out that  
4 bottom paragraph there.

5           **BY MR. TILLER:**

6           **Q.** And, Dr. Fortunak, you were here what seems like months  
7 ago at the beginning of this trial when Dr. Whitton testified  
8 the first time?

9           **A.** Yes, I was.

10          **Q.** And did you recall him -- you were here when he  
11 testified -- or strike that. Do you recall him testifying that  
12 in this Syngenta laboratory notebook it says "Subsequent to  
13 this work, 5 molar percent DABCO infringes upon Bayer patent  
14 and cannot be used. Hence, we need to repeat experiments at  
15 1 molar percent DABCO." Do you see that?

16          **A.** I do.

17          **Q.** So would you agree with me that it appears that this  
18 person, Mr. Wallace, I believe, realized that using 5 molar  
19 percent DABCO to catalyze the reaction to make -- to synthesize  
20 azoxystrobin infringed upon the Bayer patent?

21           **MR. SANTHANAM:** Objection, foundation and  
22 speculation.

23           **THE WITNESS:** But I do agree.

24           **THE COURT:** Overruled. You can consider the answer.

25           **BY MR. TILLER:**

1   **Q.**   And, again, would you agree with me that Mr. Wallace  
2   seemed to believe that, therefore, as a result, Syngenta --

3           **THE COURT:**   Well, if you would say it some different  
4   way, other than what some other person believed.

5           **MR. TILLER:**   Fair enough. I'll move forward.

6   **BY MR. TILLER:**

7   **Q.**   Now, you -- you're aware that sometimes patents do end up  
8   being invalidated in court procedures, correct?

9   **A.**   Yes, I'm aware of that.

10   **Q.**   And in those procedures where that isn't done -- where  
11   that is done, that would mean that the patent examiner did not  
12   correctly allow the patent, correct?

13   **A.**   I'm not enough of a legal expert to quite understand what  
14   your question is.

15   **Q.**   I'm just asking: You're aware the patents are sometimes  
16   found to be obvious in court proceedings, correct?

17   **A.**   That's correct.

18   **Q.**   Therefore, by definition, since the patent had been  
19   issued, if the Court or a jury finds that it was obvious, that  
20   means that it was incorrect for the patent to have been issued  
21   in the first place, correct?

22   **A.**   Correct. It doesn't mean the patent examiner got it  
23   wrong.

24   **Q.**   But it means it was --

25   **A.**   For instance, other (Cross talk) --

1   **Q.**   Fair enough. I got it. And in those cases, it would mean  
2   that the inventors or the alleged inventors, the applicants  
3   we'll call them, were incorrect in their assumption that they  
4   had invented something that was not obvious, correct?

5   **A.**   That is correct.

6   **Q.**   Now, you said when you were testifying in response to  
7   Mr. Santhanam's questions that the '138 patent has -- claims  
8   two condensation reactions. Was I correct when I heard that?

9   **A.**   I'm not sure that that was correct, but go ahead.

10   **Q.**   Well, I'm asking that first question.

11   **A.**   So the -- what we call the etherification step, right,  
12   what it involves is we have a methylene benzofuranyl. That  
13   methylene benzofuranyl is opened with --

14           **THE COURT:**   If you can keep your voice up, please.

15           **THE WITNESS:**   That methylene benzofuranyl is opened  
16   with base, with I believe it's potassium methoxide, and the  
17   phenoxide ion then reacts with 2,6 dichloropyrimidine to  
18   substitute for one of the chlorides. That product is isolated  
19   and that is the product of the etherification step.

20   **BY MR. TILLER:**

21   **Q.**   And there is a similar reaction that is disclosed in  
22   Weinritt, correct?

23   **A.**   That's correct. It is similar.

24   **Q.**   Okay. And then could you again describe the second  
25   reaction that is claimed in '138, what we've been referring to

1 as the condensation reaction?

2 **A.** So in the condensation reaction, cyanophenyl is reacted  
3 with the product of the etherification reaction in the presence  
4 of a base. In that reaction, the phenoxide displaces chloride  
5 and that is the condensation reaction that gives rise to  
6 azoxystrobin technical.

7 **Q.** And there is a similar reaction that is disclosed in the  
8 Weintritt publication, correct?

9 **A.** That's correct.

10 **Q.** Okay. Now, the testing that you heard Dr. Whitton testify  
11 to -- you heard him say that there was one sample run, correct?

12 **A.** Umm, one sample of what run, please?

13 **Q.** The Azoxy 2SC that was tested, they did -- the tests were  
14 done once. You heard Dr. Whitton say that, correct?

15 **A.** No. I heard him say that there was one sample of Azoxy  
16 2SC that was obtained. That was tested.

17 **Q.** But you didn't do any testing yourself, did you?

18 **A.** That's correct, Mr. Tiller.

19 **Q.** And you heard Dr. Whitton testify that from that testing  
20 results -- from the testing that was done he could not  
21 determine how much DABCO was used in the condensation reaction,  
22 correct?

23 **A.** I am not quite sure I heard that correctly. I think that  
24 might be what he said today.

25 **Q.** Let me ask you this: From that -- those -- are those the

1 only tests on which you are relying for your opinion?

2 **A.** No.

3 **Q.** I didn't hear you testify to any other this morning.

4                   **THE COURT:** You need to ask him a question rather  
5 than make a statement.

6 **BY MR. TILLER:**

7 **Q.** You didn't hear -- you didn't testify to any others, did  
8 you?

9 **A.** That's correct. I did not.

10 **Q.** Okay. And from that testing that Syngenta did to which  
11 you testified to, would you agree that you cannot determine how  
12 much DABCO was used in the condensation step to make the  
13 azoxystrobin which was included in that sample? Correct?

14 **A.** I'm not sure about that. My memory may be faulty, but I  
15 believe that it was approximated at 200 parts per billion.

16 **Q.** That's how much was in the Azoxy 2SC that was tested.

17 **A.** Yes. Thank you.

18 **Q.** Okay.

19                   **THE COURT:** You need to ask questions, please. You  
20 cannot testify.

21                   **MR. TILLER:** I'm sorry.

22 **BY MR. TILLER:**

23 **Q.** Is it true that was the amount of DABCO found in that  
24 sample of Azoxy 2SC?

25 **A.** Yes, that's correct.

1   **Q.**   Okay. And 200 parts per billion, is that the number you  
2   said?

3   **A.**   That's correct.

4   **Q.**   Okay. 200 parts per billion does not equate to 0.1 molar  
5   percent DABCO in the condensation reaction, does it?

6   **A.**   No, Mr. Tiller, it doesn't.

7   **Q.**   Okay. And there is no way to quantify based on Syngenta's  
8   testing -- strike that. Is there a way to quantify, based on  
9   Syngenta's testing, how much azoxystrobin was included in the  
10   condensation -- how much DABCO was included in the condensation  
11   reaction that was used to make that sample?

12   **A.**   That's correct.

13   **Q.**   Okay.

14                   **THE COURT:**   There is not a way to quantify? Is that  
15   what you are saying?

16                   **THE WITNESS:**   Yes.

17                   **THE COURT:**   Okay. Go ahead.

18                   **MR. TILLER:**   Why don't I say it again just to be  
19   clear.

20                   **THE COURT:**   Okay.

21                   **BY MR. TILLER:**

22   **Q.**   So I'll make the statement. If we're looking at Azoxy  
23   2SC, testing it, we're finding DABCO, 200 parts per billion, we  
24   cannot correlate that to a definite amount of DABCO that was  
25   used in the condensation step. The best way to figure that out

1 would be to actually go to the plant, watch the production  
2 process, and test what is being done during that production  
3 process, correct?

4 **A.** Please, can you help me? The best way to figure out the  
5 amount of azoxy in -- the amount of DABCO in azoxy technical or  
6 the amount used in the condensation reaction?

7 **Q.** It's the latter one, the amount used in the condensation  
8 reaction.

9 **A.** That is correct.

10 **Q.** Okay. And you did not do that?

11 **A.** That's correct.

12 **Q.** Okay. And you didn't ask to do that?

13 **A.** No, I did not.

14                   **MR. TILLER:** Bonnie, if we could please put up  
15 Plaintiff's Demonstrative Exhibit 27.5.

16 **BY MR. TILLER:**

17 **Q.** Dr. Fortunak, this is a table that is -- that comes  
18 directly out of the '761 patent, correct?

19 **A.** No, Mr. Tiller. If you recall, I added the third column  
20 with reaction time.

21 **Q.** You're right. I'm sorry. I -- I -- you're right. The  
22 first two columns come out of the '761 patent, Table 1,  
23 correct?

24 **A.** That's correct.

25 **Q.** And the reaction time comes out of the written disclosure

1 portion of the '761 patent, correct?

2 **A.** Correct.

3 **Q.** Okay. You would agree with me that 2 molar percent DABCO  
4 as is set forth here is outside of the claimed range, correct?

5 **A.** That's correct.

6 **Q.** So one could use 2 molar percent DABCO using the  
7 condensation reaction that is otherwise claimed in the '761  
8 patent and not fall within the scope of the claims, correct?

9 **A.** That is correct.

10 **Q.** And thus not infringe?

11 **A.** Correct.

12 **Q.** Okay. And 0.1 molar percent is also outside of the  
13 claimed range, correct?

14 **A.** I'm not sure that I recall correctly on that. I thought  
15 that the claim was between 0.1 and 2 mol percent.

16 **Q.** Exactly. It is. It's between 0.1 and 2 molar percent.  
17 Is that your memory?

18 **A.** That's correct.

19 **Q.** Okay. So would you then agree with me that 0.1 molar  
20 percent is outside of the claimed range?

21 **A.** I've got to be honest with you. I'm not sure about the  
22 legal definition of that; but if you purported to me that  
23 0.100 percent, for instance, is outside the claimed range, then  
24 I would have no reason to dispute it.

25 **Q.** Okay. And certainly you would agree with me that

1   0.9 -- 0.0999999 percent is outside of the claimed range?

2 **A.**   No, sir. We're running into a problem of significant

3 figures and basic math, so if you take it down to, like, .094.

4 **Q.**   How about we take it down to .094. That's outside of the

5 claimed range, right?

6 **A.**   That is outside the claimed range.

7 **Q.**   Okay.

8 **A.**   I'm sorry. And I'm not teasing you, rather.

9 **Q.**   I believe you. Do you recall -- strike that. Using 0.1

10 molar percent is pretty close to getting optimal when using

11 DABCO to manufacture azoxystrobin, correct?

12 **A.**   No.

13 **Q.**   It's not?

14 **A.**   It's pretty close --

15 **Q.**   Well, that's what you --

16 **A.**   I'll wait for your next question.

17 **Q.**   Well, do you recall telling me that Dr. Whitton indicated

18 to you that .1 percent was pretty close to optimal?

19 **A.**   Let's qualify what we're talking about, shall we? It is

20 pretty close to optimal yield, you'll notice, 93.4 percent, and

21 what it's not so good on is reaction time. So although the

22 reaction yield will be pretty good, it's taking you a longer

23 time to run the reaction.

24 **Q.**   Sorry. I'm looking at the wrong deposition.

25                   **MR. TILLER:** May I approach?

1                   **THE COURT:** You may.

2                   **MR. TILLER:** Counsel, we're going to be looking at  
3 page 110. I'll get you the line number in a second.

4 **BY MR. TILLER:**

5 **Q.** Doctor, I would like you to take a look at page 110 of  
6 your deposition, specifically line 16 of that page. Do you  
7 have that?

8 **A.** I do.

9 **Q.** And would you agree with me that when I asked you about  
10 .1, which was .1 molar percent DABCO, would you agree with  
11 that?

12 **A.** Yes.

13 **Q.** Okay. You said, at .1 he -- and we were talking about  
14 Dr. Whitton at that point, correct?

15 **A.** Well, I'll -- I'm sure that you've looked at this, so I'll  
16 believe you on that.

17 **Q.** You are welcome to take a look.

18 **A.** No, no, we don't need do that. It's okay.

19 **Q.** At .1 he indicated that you were pretty close to getting  
20 optimal. The difference between .1 and 1 percent was, if  
21 anything, very small. Do you see that?

22 **A.** I do.

23 **Q.** Okay. And there you didn't mention anything about the  
24 time difference, correct?

25 **A.** That's correct.

1   **Q.**   Okay. Now, the time can also be shortened by increasing  
2   the temperature, correct, at which the reaction is done?

3   **A.**   That is correct.

4   **Q.**   Okay. And are you aware that in the '761 patent the  
5   example at 0.1 molar percent was done at 80 degrees Celsius?

6   **A.**   If you purport that to me, I'm --

7   **Q.**   I'm happy to show it to you if you want, but --

8   **A.**   No, I'll accept that.

9   **Q.**   Okay. And do you recall that Tai He or Tie Ha (phonetic),  
10   as it has sometimes been called, does its reaction at about  
11   120 degrees Celsius?

12   **A.**   I believe that's correct for the condensation step, yes.

13   **Q.**   And that increase in temperature would increase the speed  
14   at which the reaction occurs, correct?

15   **A.**   That is correct.

16   **Q.**   And you're aware that -- prior to conceiving of the method  
17   that is claimed in the '761 patent, you're aware that Syngenta  
18   used essentially the reaction that is claimed in the '138  
19   patent, correct?

20   **A.**   I think you used the word "conceived," is that right?

21   **Q.**   I did use the word "conceived."

22   **A.**   I'm sorry. I misheard you. I thought you said conceded.

23   **Q.**   I guess that's a patent term. I'm sorry. I probably  
24   shouldn't have. How about -- let me ask it again because  
25   you're right, conception is for --

1                   **THE COURT:** Okay. Just ask your question.

2                   **BY MR. TILLER:**

3                   **Q.** Before coming up with the DABCO method, Syngenta was  
4 making azoxystrobin, correct?

5                   **A.** That's correct.

6                   **Q.** And it was making azoxystrobin without DABCO, correct?

7                   **A.** That's correct.

8                   **Q.** And it did that for, I think, eight or nine years,  
9 correct?

10                  **A.** Some number of years, correct.

11                  **MR. TILLER:** Your Honor, if I can take two seconds, I  
12 might be done.

13                  **THE COURT:** All right.

14                  (Pause in the proceedings.)

15                  **MR. TILLER:** Nothing further, Your Honor.

16                  **THE COURT:** Any redirect?

17                  **MR. SANTHANAM:** None, Your Honor.

18                  **THE COURT:** You can step down.

19                  (The witness left the stand.)

20                  **THE COURT:** Further evidence for Syngenta?

21                  **MR. LEVINE:** No, Your Honor. Syngenta rests.

22                  **THE COURT:** Okay. Can I speak to counsel just very  
23 briefly about scheduling up here at the bench?

24                  (Bench conference as follows:)

25                  **THE COURT:** Are you going to have anymore evidence?

1 No. Okay. I'll just ask you that on the record and you can  
2 say that in front of the jury and I'll let them go home for the  
3 day.

4 (Bench conference concluded.)

5 **THE COURT:** We'll now repeat what we said.

6 Mr. Tiller, is there any further evidence for  
7 Willowood?

8 **MR. TILLER:** None, Your Honor.

9 **THE COURT:** Okay. All right. Ladies and gentlemen,  
10 you've heard all of the evidence and it will be your job  
11 tomorrow to decide from this evidence what the facts are and to  
12 apply the law that I will give you to those facts. You'll have  
13 a number of questions to answer on a verdict sheet and we will  
14 have all of that ready for you in the morning. But because I  
15 have to talk to them and get all of that organized, I'm just  
16 going to let you go home for the day and we will start fresh in  
17 the morning with the closing arguments and then I'll instruct  
18 you on the law.

19 Now, even though you have heard all of the evidence,  
20 you've not heard the closing arguments of the attorneys and you  
21 haven't heard my final instructions on the law, so I want to  
22 instruct you and encourage you to keep an open mind. Wait  
23 until you've heard everything to start forming an opinion and  
24 wait until you start talking to your fellow jurors.

25 So we will take care of all of that tomorrow and my

1 best guess is you'll get the arguments in the morning, I'll  
2 instruct you on the law, and you all will start deliberating  
3 maybe right before lunch or right after lunch, something like  
4 that.

5 So I'm going to have you come back at 9:30. It's  
6 possible we might not get started just quite that early, but  
7 we're going to shoot for that.

8 I'll ask you again and instruct you not to have any  
9 contact with the lawyers, parties or witnesses. Do not look  
10 anything up online or conduct any independent investigation.  
11 Don't read or listen to any news reports that there may be  
12 about the case and, of course, don't talk or communicate about  
13 the matter.

14 I'll see you all at 9:30 in the morning. The jury is  
15 excused.

16 (The jury left the courtroom at 3:35 p.m.)
